Summary

Objective & approach

Our objective in this report is to provide forecasts of residential building, non-residential building, and renewable energy investment construction, by network area, for CitiPower, Powercor and United Energy, including detailed commentary, graphs and other supporting information.

The forecasts cover the period through to June 2031. Macromonitor is well placed to provide these forecasts, as a result of our regular, extensive analysis and forecasting work at the state and regional level, covering demographics, households, dwellings, non-residential buildings and electricity construction.

Macromonitor has extensive experience in forecasting building and construction activity. We are highly regarded for our forecasting techniques and the thoroughness of the research which underlies our forecasts.

Residential building

Victoria experienced a large downturn in the number of new dwellings approved and commenced during 2022 and 2023. The most recent data, however, suggest a tentative upturn has been underway since mid-2024. The main drivers of the upturn are interest rate reductions, economic & employment growth, strong population growth and government programs and policies. Government policy at both the Federal and State level will be supportive of the upturn.

We expect growth in total dwelling approvals to accelerate, from around 9% in 2024/25, to 13% in 2025/26. We expect the current upturn to be quite large overall, with an increase of around 30% in the number of dwellings commenced, between the low point of 2024 and the peak in 2027.

So far, we have seen the most growth in the Citipower region, where residential approvals more than doubled in 2024/25, and commencements increased an estimated 49%. This likely means, however, that there is more growth potential, from this point on, in the United Energy and Powercor regions, which are still running well below their estimated level of annual occupant demand (which is based on demographics).

In particular, we expect considerable growth in the United Energy region, where commencements continued to decline in 2024/25, where activity is running well below occupant demand, and where there will be eventual benefits from the residential component of the Suburban Rail Loop East project. We expect the number of dwelling starts to increase by 43% in the United Energy region over 2025/26 and 2026/27.

Non-residential building

In Victoria, non-residential building activity has been running at extraordinary high levels over the past five years. A huge surge in office construction was initially the main driver. Accommodation, warehouses, factories, education and transport also drove the boom. More recently, health and other commercial (data centres) have been the primary drivers of work done.

Commencements peaked in 2022/23 at \$20 billion. Commencements have since declined, due to falls across most commercial and industrial segments line with the broader slowdown in the economy, as well as declines in education and health building starts. Commercial and industrial space is now being added at a time when the economy is slowing. Consequently, there will be little incentive for new investment over the next few years.

A record peak in work done of \$19.1 billion was reached in calendar 2023, above the previous peak of 2019/20. Work done has remained high, just below \$19 billion, to December 2024. From here, work done will follow the decline in commencements. We forecast annual work done to edge down to \$17.5 billion in the second half of 2025.

Looking longer term, annual work done is expected to remain anchored between \$17 billion and \$18 billion through to 2030/31. This level of activity is very high from a historical perspective.

In the CitiPower and United Energy regions, work done is estimated to have declined in 2023/24 and 2024/25, due to weakness in key non-residential building segments. However, the CitiPower region is estimated to have seen a steep rise in commencements in 2024/25, which will flow though to work done over the next few years. Key drivers will be retail, education, aged care and accommodation. In the United Energy region, we also forecast a steady upturn in work done from 2025/26 to 2029/30, due to offices, health and accommodation.

Construction in the Powercor region has been steady over the last few years, with an increase of 14.3% in work done estimated over the year to June 2024, largely due to strength in health and education. However, we forecast a downturn from 2024/25 through to 2027/28, due to board-based declines.

Renewable energy

Construction activities in the renewable energy sector in Victoria have experienced significant acceleration in recent years. Since 2022/23, there has been a resurgence in total renewable energy construction, with work done increasing by 82% over the year to June 2024, to \$1.2 billion. Work done is estimated to have more than doubled again in 2024/25. This growth has been driven by upturns across all segments.

This upturn is forecast to reach its peak, at \$4 billion, in 2027/28, mainly driven by large wind projects. This peak level of construction also coincides with the state's target of 40% renewable energy by 2025.

Despite expected declines in construction activity in the subsequent three years to 2030/31, total value of work done will remain elevated, above \$3 billion annually. This level of investment remains substantially higher than it has been in the past.

Geographic regions

We provide data and forecasts for three geographic regions, which approximately match the network areas of the three businesses: CitiPower, Powercor and United Energy.

We have described the three geographic areas using the 'Australian Statistical Geography Standard' (ASGS) which is used by the Australian Bureau of Statistics (ABS). From the ASGS, we use a combination of SA2, SA3 and SA4 regions to define the regions. The table below outlines the ASGS regions that are included in each of the three business areas.

Table 1
Macromonitor's Approximate Geographic Regions

| CitiPower | United Energy | Powercor |
|--|---|--|
| 206: Melbourne – Inner: - 20601 Brunswick - Coburg - 20602 Darebin - South | 207: Melbourne – Inner East: - 20702 Manningham – West - 20703 Whitehorse – West | 201: Ballarat - All |

1. Residential Building Forecasts

1.1 Outlook for Victoria

Victoria experiencing a large downturn in the number of new dwellings approved and commenced during 2022 and 2023. This was the result of a period of high interest rates, combined with a decline following the end of the *HomeBuilder* scheme. The number of dwellings approved and commenced both dropped around 30% between 2021 and 2023.

The most recent data, however, suggest a tentative upturn has been underway since mid-2024. The latest data shows an increase in total dwellings approved of around 9% in the year to June 2025, and an increase of around 4% in the number of dwellings commenced in the year to March 2025 (we don't yet have commencements data for the June quarter).

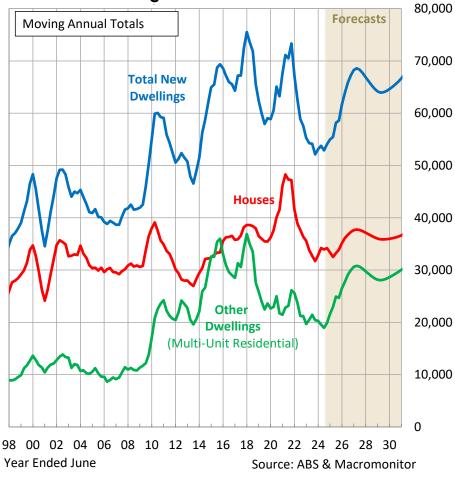

A number of key leading indicators are now either stable or have moved into positive territory, and the backlog of work still to be done on residential building is consistently falling, which means that capacity within the building industry is becoming available for an increase in starts.

The main drivers of the upturn are interest rates, economic & employment growth, population growth and government programs and policies.

In terms of timing, interest rates are a key factor. There have been three reductions in official interest rates by the Reserve bank in 2025 so far (the first being in February). We expect two more cuts by early 2026, although a third is also possible during this time frame.

On the demand side, the requirement for new dwellings is high, due to record levels of immigration, but affordability has thus far been poor. Along with lower interest rates, a

Chart 2
Number of Dwellings Commenced - Victoria

normalisation of building cost inflation during 2025 has helped affordability and will underpin a further strengthening of new building.

Total net migration inflows into Victoria reached an all-time high in calendar 2023, with close to 160,000 people into Victoria, compared to a pre-COVID peak of around 100,000 in 2016 and 2017. Migration has dropped back somewhat, but still sits around 100,000 annually. High migration flows are driving an increase in occupant demand. We estimate that occupant demand was around 54,000 dwellings per year in the five years 2016 to 2021, but is now around 65,000 dwellings per year.

We expect growth in total dwelling approvals to accelerate, from around 9% in 2024/25, to 13% in 2025/26. We expect the current upturn to be quite large overall, with an increase of around 30% in the number of dwellings commenced, between the low point of 2024 and the peak in 2027. In percentage terms, this upturn is forecast to be very similar to the two previous upturns (2007 to 2010 and 2013 to 2016) but smaller than some prior upturns.

Government policy at both the Federal and State level will be supportive of the upturn. This includes the National Housing Accord, Housing Australia Future Fund and Social Housing Accelerator Payment at the national level.

At the state level, changes to planning to allow for higher density residential development around public transport will be helpful, including dwellings associated with the Suburban Rail Loop (SRL) and the Activity Centres Program. The effects of these planning and zoning changes are quite

long term in nature, and are essentially facilitating measures, rather than being causal of an upturn in the short to medium term. The government's aims for new dwellings in the Activity Centres and around the SRL stations has a time horizon the stretches through to the 2050s.

The hope is to facilitate around 70,000 new dwellings around SRL stations, and around 360,000 new dwellings in activity centres – all by the 2050s. As well as being quite long term in focus, many of these new dwellings will be located outside of the business areas covered by this report.

One implication of these policy and planning changes will be that growth in multi-dwelling residential (high and medium density dwellings) is likely to increase substantially more than the increase in detached houses over the next few years and beyond.

Another downturn is then expected at the end of the forecast period, from around 2028.

1.2 Regional Breakdown

To produce forecasts for each region, we have, first, estimated occupant demand by region. Occupant demand is demand based on population growth, the age profile of population growth, household formation rates within age groups, share of type of household living arrangement by age group, and other demographic factors. The demographic profiles of each region can be quite different, so we initially estimate this measure of demand.

We estimate that current occupant demand (annual demand during the ten years from 2022 to 2031), in the three regions is as follows:

- Powercor region around 21,000 dwellings per year,
- United Energy region around 11,500 dwellings per year,
- CitiPower region around 10,400 dwellings per year.

Chart 3 Residential Building - Victoria Regions **Number of Dwellings Commenced** \$ M 80,000 **Forecasts** 75,000 70,000 Victoria 65,000 60,000 55,000 50,000 45,000 40,000 19 20 21 22 24 25 26 29 30 16 17 18 23 \$ M 30,000 **Forecasts Powercor** 25,000 Other regions 20,000 15,000 **United Energy** 10,000 Citipower 5,000 0

26 27 28 29 30

Source: ABS & Macromonitor

Year Ended June

14 15 16 17 18 19 20

In conjunction with these long run population drivers, there are cycles in activity in each region which move the actual number of dwellings built above and below occupant demand over time. The drivers of these cycles are largely the same as the state-wide drivers described above; namely, interest rates, State and Federal government incentives, economic growth and employment, swings in broader migration patterns etc.

Policy and planning changes also affect the regions differently. The potential residential developments associated with the SRL project will primarily impact the United Energy region over the next six years, due to the initial focus on the SRL – East component. The Activity Centres initiative will primarily affect the United Energy and Citipower regions, although the exact impact on each region isn't really possible to determine at this stage.

Both the Citipower and United Energy regions have entered an upturn, in terms of the number of approvals, but only the Citipower region saw an actual increase in dwelling starts in 2024/25. The Powercor region continued to experience declines in both approvals and commencements in 2024/25.

So far, we have seen the most growth in the Citipower region, where residential approvals more than doubled in 2024/25, and commencements increased an estimated 49%. This likely means, however, that there is more growth potential, from this point on, in the United Energy and Powercor regions, which are still running well below their estimated level of annual occupant demand.

In particular, we expect considerable growth in the United Energy region, where commencements continued to decline in 2024/25, where activity is running well below occupant demand, and where there will be eventual benefits from the residential component of the Suburban Rail Loop East project. We expect the number of dwelling starts to increase by 43% in the United Energy region over 2025/26 and 2026/27.

All regions are expected to register growth, in both approvals and commencements, in 2025/26 and 2026/27. And looking further ahead, we expect the upturn in dwelling commencements to peak around 2026/27, followed by a two-year downturn.

1.3 Forecasting Methodology

Our forecasting approach involves examining two types of demand for dwellings:

- Occupant demand or the number of dwellings required to house the population, based on projections of the size and composition of the population and a given set of household formation behaviour assumptions, and
- **Purchaser demand** or the actual number of new dwellings purchased, or paid for, by the various categories of buyers.

Occupant demand should be looked at as a long run determinant of dwelling construction levels, while purchaser demand (the actual decisions made to construct or purchase a new dwelling), drives the year-to-year, cyclical fluctuations. In reality, these two types of demand are not independent, as greater supply (created by the purchasers) can lead to greater demand from occupants and vice versa. They need to be examined in conjunction in order to build a complete picture of the market. Over the long term (over a five or ten-year period) occupant demand should equal purchaser demand, which equals the total number of dwellings built.

The Australian Bureau of Statistics (ABS) releases residential building approvals data at the SA4, SA3 and SA2 regional levels. We use these data to estimate commencements at the regional level by allocating activity according to the proportion of approvals in the region.

2. Non-residential Building Forecasts

2.1 Outlook for Victoria

Non-residential building activity in Australia is set to is set to continue to a record peak in 2025/26. National activity is being primarily supported primarily by government building work, in particular major hospital projects. We forecast a downturn in national work done from 2025/26. However, level of activity is expected to remain at a very high level from a historical perspective.

In Victoria, non-residential building activity has been running at extraordinary levels over the past five years, with total work done for the sector averaging around \$17 billion per year since 2017/18, compared to the \$11 billion average for the ten years prior (both in 2022/23 constant prices).

A huge surge in office construction was initially the main driver.

Accommodation, warehouses, factories, education and transport were also strong sources of support. More recently, health and other commercial (data centres) have been the primary drivers of work done.

Commencements peaked in 2022/23 at \$20 billion.
Commencements have since declined, by 21.8% over the year to June 2024, due to falls across most commercial and industrial segments as a result of slowing economic growth, as well as declines in education and health building starts.

Chart 4
Commercial Building - Victoria

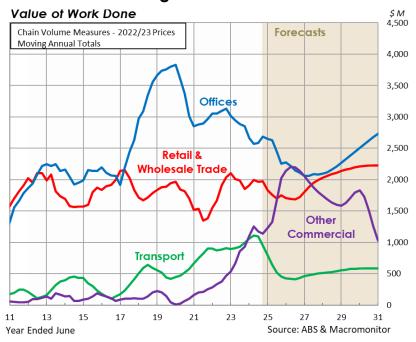

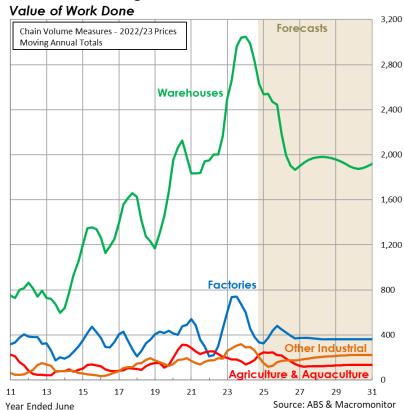

Chart 5 Industrial Building - Victoria

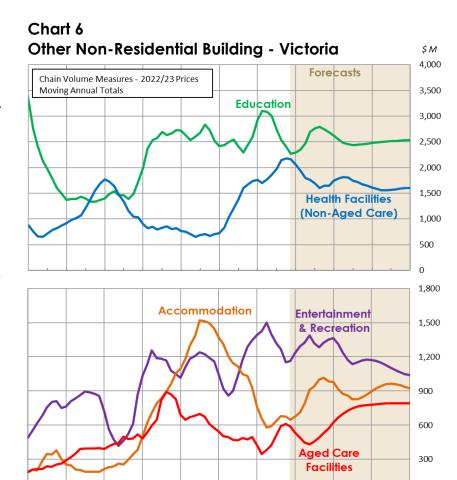

n

31

Source: ABS & Macromonitor

A low of \$14.9 billion was reached in calendar 2024. We estimate an uptick in commencements of 14% over the year to June 2025. This is due a new surge in health building commencements, as well as renewed strength in data centres, offices, factories, education and accommodation. We forecast commencements to fall once again from mid-2026.

Commercial and industrial space is now being added at a time when the economy is slowing.
Consequently, there will be little incentive for new investment, and this will lead to the expected decline in private sector commencements in 2025/26.

The Victorian Government is facing mounting pressure to reign in public spending following large investments in projects in response to the pandemic. High inflation and labour market shortages, especially in the infrastructure sector, resulted in sharply rising project costs. This is compounded by the slowing of the economy, which is lowering government revenue growth.

Year Ended June

Although there are budgetary constraints, we still expect government spending to remain relatively high with major health and education projects to commence in 2024/25. However, a decline in public sector building commencements is forecast for 2025/26 and 2026/27.

Work done increased by 11.2% to \$18.5 billion in the year to June 2023, taking activity above the previous record peak of 2019/20. A peak of \$19.1 billion was reached in calendar 2023. Work done has remained high, just below \$19 billion, to December 2024. This growth was driven by upturns warehouses, factories, transport, other commercial, education and health. Looking ahead, the main sources of strength will be education, health, and other commercial (data centres).

From here, work done will follow the decline in commencements. We forecast annual work done to edge down to \$17.5 billion in the second half of 2025. Looking longer term, annual work done is expected to remain anchored between \$17 billion and \$18 billion to 2030/31. This level of activity is very high from a historical perspective.

2.2 Regional Breakdown

Victoria's non-residential building construction is spread reasonably evenly across the three business regions, and the rest of Victoria, albeit with the United Energy region being a bit smaller than the others. On our calculations, on average over the last five years, around 30% of the value of Victoria's nonresidential building construction has taken place in the Citipower business region, 17% in the United Energy business region and 27% in the Powercor business region.

In the CitiPower region, the largest non-residential building segment by far is offices. Activity is supplemented by education, health, accommodation and entertainment and recreation. Work done fell in 2023/24 and is estimated to have declined again in 2024/25 due to weakness in some of these segments. However, a

steep rise in 2024/25 commencements is estimated, which will then flow though to work done. We forecast a steady upturn in work done in the CitiPower region from 2025/26 to 2029/30, driven by strength in retail, education, aged care and accommodation.

In the United Energy region, the biggest segments are retail and education, followed by warehouses and health. Work done in the region fell in 2023/24, with another drop estimated in 2024/25, largely due to falls in retail and warehouses, followed by falls in health and education in 2025. We forecast a steady upturn in work done from 2025/26 to 2029/30, due to offices, health and accommodation.

Construction in the Powercor region is dominated by warehouses, education, health and retail. We estimate growth in work done has been steady over the last five years, with an increase of 14.3% over the year to June 2024, largely due to strength in health and education. However, we forecast a downturn from 2024/25 through to 2027/28, due to board-based declines.

2.3 Forecasting Methodology

The forecasts for non-residential building are derived from the combination of a detailed assessment of known projects, and a thorough analysis of the economic and broader market influences on each sector. We start with a bottom-up approach, assessing current and planned projects and expected start and delivery dates. We add to this a top down analysis of the economic and market drivers, which are different for each sector.

Commercial building is influenced by:

- economic conditions,
- the rate of growth in employment,
- the demand for each type of space, and
- overall market conditions (as measured by vacancy or occupancy rates, rents and values).

Government building is influenced by:

- the economy, and
- by overall budgetary positions, fiscal policy and political factors.

In the near term, (the next 6-12 months), our commencements forecasts are guided by the latest approvals data, commencements usually lag approvals by around 6 months. Over the long-term commencements should equal to approvals.

In the short term (the next one to two years), the bottom-up project analysis is more influential in our forecasts. Further out, there is less generally specific, reliable information available on projects, and hence the macro level drivers become more important. It is important to note that, even in the short term, there is a 'residual' of work that is not accounted for by known major projects, and this element of activity must be forecast with reference to top-down factors.

Further out, a larger proportion of forecast activity is comprised of this 'residual' element, or in other words, projects not yet known. Also, the timing of planned projects beyond the next year or two must be considered variable and under the influence of economic and market conditions. For these reasons, our assumptions regarding the economic outlook, and the outlook for the other important macro drivers, play an increasingly important role in our forecasts the further we move out in the future.

The Australian Bureau of Statistics (ABS) releases non-residential building approvals data at the SA2, SA3 and SA4 regional levels. We use these data, combined with our lists of major projects broken down by sector and region, to estimate commencements and work done at the regional level.

3. Renewable Energy Construction Forecasts

3.1 Outlook for Victoria

Construction activities in the renewable energy sector in Victoria have experienced significant acceleration in recent years, with total annual value of annual work done going from \$860 million in 2020/21 to an estimated \$2.6 billion in 2024/25 (both figures in constant 2022/23 prices). (These figures do not include renewable energy-related transmission projects).

This upward trend is expected to continue, with more growth forecast over the next two years. We expect a peak of \$4 billion in 2027/28, followed by gradual decline. But despite the expected downturn from 2028/29, investment in renewable energy investment will remain substantially higher than it has been in the past.

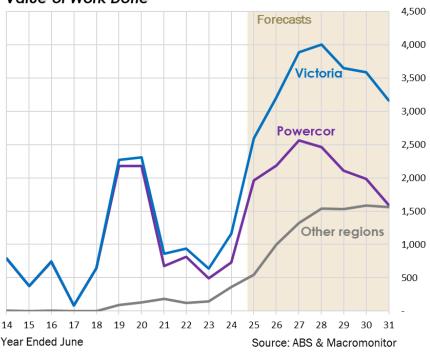

This upswing in construction activity is being supported by Victoria's ambitious Renewable Energy Targets, aiming for 65% by 2030 and 95% by 2035. These targets are underpinned by a robust framework of policies and incentives, prominently reflected in the state's budget, which is designed to facilitate and incentivize investments in the renewable energy sector.

The wind sector plays a central role in Victoria's renewable energy mix, and offshore wind projects are set to boost construction activities in coming years. On average, work in the wind sector has contributed 75% of total renewable energy work done over the last ten years. The dominance of wind will ease somewhat on our forecasts, due to strong upturns in both solar and battery construction.

Looking back over the past decade, a strong upturn began in 2017/18, construction activity rose to an unprecedented peak of \$2.3 billion in 2019/20 (in constant 2022/23 prices). During this peak period, the wind sector dominated overall renewable construction.

The peak in construction activities in 2019/20 was triggered by state's Renewable Energy Target to have 25% share of renewables in its energy mix by 2020. In 2020, Victoria surpassed its first target of 25 per cent renewable electricity.

Chart 9
Renewable Energy Construction - Victoria Regions
Value of Work Done

Construction activities dipped in 2020/21 as wind projects were completed. Wind construction activities saw a downturn, with an average construction work done of \$500 million per year between 2021 and 2024. This resulted in a decline in total renewable energy construction work done to \$640 million in 2022/23.

Since 2022/23, there has been a resurgence in total renewable energy construction, increasing by 82% over the year to June 2024 to \$1.2 billion. Work done is estimated to have more than doubled from this level in the year to June 2025. This renewed growth has been driven by upturns in all segments.

This upturn is expected to reach its peak, at \$4 billion, in 2027/28, mainly driven by large wind projects. This peak level of construction also coincides with the state's target of 40% renewable energy by 2025. Despite expected declines in construction activity in the subsequent three years to 2030/31, total value of work done will remain elevated, above \$3 billion annually.

Solar work done surged from \$100 million in 2022/23 to an estimated \$600 million in 2024/25. We forecast solar work done to peak at \$1.2 billion in 2026/27, before entering a long downturn. Projects of note in the Powercor region include: Corop Solar Farm, Mortlake Energy Hub, Barwon Solar Farm, Elaine solar farm and the Horsham Solar Farm.

Battery and other renewables construction work done has surged over the last two years, to an estimated \$1.2 billion in 2024/25. We forecast work done to be sustained at this level for a further two years, to 2026/27. Battery and other renewables construction work done is then projected to decline, but remain high from a historical perspective, at an average of \$700 million annually over the four years to 2030/31. Notable projects in the Powercor region include: Melbourne Renewable Energy Hub, Mortlake Power Station Battery, Victorian Big Battery 2, Pine Lodge BESS, Koorangie Energy Storage System and the Victorian Big Battery.

Victoria's offshore wind targets (at least 2 GW of offshore generation capacity by 2032, 4 GW by 2035, 9 GW by 2040) will provide additional momentum to wind construction activities in the latter half of the forecast period. We expect wind construction activity to rise from the current level of \$800 million to \$2.4 billion by 2027/28, and remain at this level to 2029/30. Prominent offshore wind projects in Victoria's BASS Strait off Gippsland (Australia's first offshore wind zone), driving this sustained construction activity are the \$8 billion Star of South and the \$7.7 billion Greater Gippsland Offshore Wind Project. Note that these projects, which are key drivers of Victoria's medium to long run growth in renewables, are all outside of the business regions covered by this report.

Victoria's growth in renewable energy construction aligns with its ambitious Renewable Energy Targets of 65% by 2030 and 95% by 2035, bolstered by substantial policy initiatives and budget allocations. The Victoria-Commonwealth agreement has earmarked \$2.25 billion for REZ projects, including offshore wind initiatives and the Victoria-New South Wales Interconnector (VNI West), facilitated by Rewiring the Nation funds. To streamline offshore wind progress, Offshore Wind Energy Victoria (OWEV) has been established, aiming to kickstart a competitive procurement process by 2025 for achieving the 2 GW target by 2032.

Victoria has also allocated a significant \$1.6 billion energy package to advance clean energy initiatives. Key projects include the Bulgana Green Power Hub, Victorian Hydrogen Hub, and Renewable Energy Zones. The state government actively supports community renewable energy projects and offers incentives for investment and innovation in the renewable energy sector.

Victoria's emphasis on energy storage, targeting 2.6 GW by 2030 and 6.3 GW by 2035, will also strengthen the momentum in renewable energy construction.

3.2 Regional Breakdown

There is generally only a small amount of renewable energy construction in the CitiPower and United Energy business regions. Most of Victoria's renewable energy construction takes place in the Powercor business region. On our calculations, around 90% of the value of Victoria's renewable energy construction over the past decade has taken place in the Powercor business region.

Consequently, all of the comments above regarding Victoria's renewable energy construction outlook applies equally to the Powercor region, and there is little to say about the CitiPower and United Energy regions, which will remain relatively insignificant in their constructions to total renewable energy construction.

Looking ahead, there will be a number of significant renewable energy projects located in Latrobe - Gippsland and Hume. These regions lie outside of the Powercor, United Energy and CitiPower regions, as such we expect construction activity in 'Other regions' in Victoria to increase in prominence during the forecast period.

The project list and tables on the following pages provide further information and forecasts for construction activity by region. These tables are also provided in Excel format. The project list, in particular, is better viewed in Excel, where it has more information on expected year-by-year expenditure.

3.3 Forecasting Methodology

Our forecasting work for of renewable energy involves the collection of project information and other data and information on each segment of activity, in each region, as well as undertaking analysis on the drivers and trends in the industry and making projections.

The renewable energy data includes new power stations, hydro-electric generating plants, wind farms, utility-scale solar farms, and pumped hydro generation, as well as associated work to support generation assets. But it excludes rooftop photovoltaic solar systems, which are a notable portion of renewable energy generation.

Some potential limitations to the data include under-coverage of renewable investment due to unidentified projects, units not selected or reporting incorrectly, data reported in commodities other than electricity, and small-scale utility renewable projects not identified for tracking.

Our forecasts are based on both sourced information regarding future work programs and projects, as well as our own judgment and modelling of the economic drivers of this sector.

Renewable energy generation construction is also classified into two distinct categories based on their connection to the power grid and their generation capacity. The first category is the value of transmission-connected renewable generation. This encompasses large-scale projects with a capacity exceeding 200 megawatts (MW). These substantial installations are directly connected to the high-voltage transmission network, allowing them to feed large amounts of clean energy into the grid over long distances.

The second category is the value of distribution-connected renewable generation. This includes smaller projects with a capacity below 200 MW. These installations are typically connected to the local distribution network, often closer to the point of energy consumption.

Table 10 Major Renewable Energy Construction Projects - Victoria
