Jemena Electricity Networks (Vic) Ltd

Response to the annual Regulatory Information Notice for the 2013 regulatory year

Appendix 1-1

RIN template appendix B – Regulatory accounting statement templates

Public

30 April 2014

Distribution Network Service Provider
Annual reporting template

This template is to be used by a DNSP to fulfil its annual reporting obligations to the AER.

Colour coding of input sheets:
Dark blue = AER instructions/headings
Yellow = Input cells
Grey - Not applicable/No inputs required

Leave coloured cells blank if no information exists - PLEASE DO NOT ENTER TEXT unless specifically requested to do so.
All dollar amounts are to be unrounded, and in nominal terms.

DNSP - trading name:	**Jemena Electricity Networks (Vic) Limited**
DNSP - Australian business number:	**82 064 651 083**
Reporting year:	**2013**

		-	0										

Note:
Balancing is required at JEN distribution business level
In addition it is mandatory to produce for each cost or revenue item that has been allocated to the distribution services/AMI a supporting workpaper that includes the following:
a) the amounts that have been directly attributed to each distribution service
b) the amounts that have been allocated to each distribution service
c) a description of the allocation basis
d) the numeric quantity of each allocator.
Designated pricing approval charges include SPI connection fees, AEMO shared transmission charges, net cross boundary charges, avoided TUoS/avoided transmission costs.

.

Customer contributions reported above under the 'JEN' column includes pole to pits elective undergrounding.

JEN's explanatory notes:

1 JEN has highlighted errors in Template 1 in bold red font. Details as follows:

Designated Pricing Proposal Charges (cell C11):

The wording in cell C11 should be Designated Approval Charges.
Designated Approval Charges is the revenue collected in relation to items such as Transmission Use of System tariffs as approved by the AER.
Therefore, it is reported under the Revenue section of an income statement.
JEN has reported its Designated Pricing Approval Charges in row 11.

Designated Pricing Approval Charges (cell C19):

The wording in cell C19 should be Designated Pricing Proposal charges.
Designated Pricing Proposal charges are the pass through costs incurred by a distribution business.
Consistent with Template 12 of Appendix B, JEN has reported Designated Pricing Proposal charges in row 19.

JEN (cell C22)

The wording for cell C22 should be Operating Expenses.

2 JEN has populated Template 1 sourcing data from other templates within Appendix B.
The other source templates are the supporting workpapers for Template 1.
The basis of allocation and numeric quantity of each allocator are detailed in JEN's response to Sections 2 and 3 of Schedule 1 to the RIN.

Depreciation (cell C23)

The allocation of accounting depreciation to SCS and other services is based on the depreciation profile as reported in Table 2 of Template 7 in JEN's RIN 2012.
Depreciation for AMI is directly sourced from the General Ledger.

3 Audited Statutory Financial Statements (column D)
Where the disclosures in the RIN template align with the audited statutory financial statements, the figures are sourced from the audited statutory financial statements. Where this is not possible, the figures are sourced from the audited trial balance of those audited statutory financial statements.

Jemena Electricity Networks (Vic) Limited
Labour and Non-Labour Costs
2013

Account code or reference to account code	Description	Labour Costs	Non-Labour Costs	Total
		$'000 nominal	$'000 nominal	$'000 nominal
	Operating Expenditure	18,884	28,330	47,213
	Maintenance Expenditure	10,162	15,245	25,407
	Capital Expenditure	42,125	74,505	116,630
	Total	71,170	118,080	189,250

Totals are representative of Standard Control Services in all schedules.
Percentage splits gained by using the labour/Non labour split as found in the GL accounts of Jemena Asset Management.
and where Capex is concerned also including the labour portion of WOBCA.

JEN's explanatory notes:

1 JEN reports the labour and non-labour costs for Standard Control activities in the table above.

2 For capital expenditure, JEN reports the labour and non-labour cost split for net capital expenditure (after netting off customer contribution).

	Other adjustments (a)											
	Closing Balance	**(206)**	-	**(206)**	**(206)**	-	-	-	-	-	-	-

a: Please explain other adjustments in the table below:

Account code or reference to account code	Provision Name	Audited Statutory Financial Statements	Adjustments	JEN	Standard Control Services	AMI	Public Lighting - Alternative Control		Other Alternative Control Services		Negotiated Services	Unregulated Services
							Energy efficient	Non-energy efficient	Fee based service	Quoted service		
		$'000 nominal	$'000 nominal	$'000 nominal	$'000 nominal	$'000 nominal	$'000 nominal	$'000 nominal	$'000 nominal	$'000 nominal	$'000 nominal	$'000 nominal

JEN's explanatory notes:

1 As JEN does not have 'Other adjustment(s)', the second table has been left intentionally blank.

2 The details of the provisions are set out below.

2.1 GL accounts

Provision JSAP		Balance @ Dec 13	Balance @ Dec 12	Difference
1280900000	Provision for Doubtful Debts	(21,047)	(45,684)	24,637
2280100300	Uninsured Losses	(184,544)	(335,301)	150,758
		(205,591)	(380,985)	175,394

2.2 Provision for Doubtful Debts

Provision for doubtful debts has been made in accordance to JEN's company policy for amounts unpaid for more than 60 days.
The provision is increased or decreased reflecting the change in the provisions as shown in Note 2.1 above.
The provision includes a credit note of $29k to AGL for illegal use of electricity at NMI 6001317972 -10 Langford Drive Craigieburn. AGL is yet to take up the credit.

2.3 Uninsured Losses

Provision for Uninsured Losses has been made for potential customer claims against JEN for damages to customers' property caused by JEN network incidents.
These claims could be based on various damages, e.g. motor burn out, fires, wiring, abandonment of food, etc.
The provision is increased or decreased reflecting the change in the provisions as shown in Note 2.1 above.

3 Where the disclosures in the RIN template align with the audited statutory financial statements, the figures are sourced from the audited statutory financial statements. Where this is not possible, the figures are sourced from the audited trial balance of those audited statutory financial statements.

	-	22,150	22,150	21,538	-	-	230	295	54	-	33

JEN's explanatory notes:

1 All items have been allocated in accordance with the approved Cost Allocation Methodology (CAM), formerly known as WOBCA.

2 The explanation of cost allocation between distribution and non-distribution business is set out in worksheet 17A.

3 Where the disclosures in the RIN template align with the audited statutory financial statements, the figures are sourced from the audited statutory financial statements. Where this is not possible, the figures are sourced from the audited trial balance of those audited statutory financial statements.

17A Shared costs

In addition to direct costs, Jemena Ltd. (**JEM**) and the service companies also incur indirect costs. These indirect costs are incurred as a result of the delivery of services associated with a particular client or multiple client contracts across the Jemena Group, but cannot be readily allocated to individual jobs or projects.
There are two main categories of indirect costs, namely JEM indirect corporate Enterprise Service Function (**ESF**) costs and Jemena Asset Management (**JAM**) regional and corporate indirect costs.

1 Whole of Business Cost Allocation model

To ensure appropriate allocation of all indirect costs, JEM uses a Whole of Business Cost Allocation (WOBCA) methodology which forms a part of JEM's Cost Allocation Policy. This policy is subject to continuing improvement in costing methodologies and changes in business structure.

WOBCA was designed to remove the potential double counting of operating costs and any costs that are specifically excluded for regulatory accounting and reporting purposes in a given regulatory reporting period. A number of steps in the preparation of indirect operating costs, prior to the allocation calculation being performed, are designed to eliminate such costs. This is achieved by:

- extracting the financial data from all ledgers for the same time period;
- removing any costs that are specifically excluded for regulatory accounting and reporting purposes; and
- performing reconciliations to check that the total operating cost pool is reconciled to the post-allocated cost pool.

2 ESF costs

JEM builds, owns and manages a combination of major electricity, gas and water assets. JEM ESF corporate costs are those costs incurred in the provision of corporate services to the associated companies, which include Jemena wholly owned assets, partly owned assets and assets managed by Zinfra under contract.
Under WOBCA, ESF costs - comprising CEO, Strategy, Finance, Audit, Risk, HR, HSE, legal, IT and other similar functions - are primarily allocated to JEM's assets (wholly and partly owned) and to JAM. The primary allocation is based on a reasonable causal relationship between the cost incurred and the service consumed. The major primary allocation drivers are:

- Timewriting data;
- Info Systems driver;
- Insurance driver; and
- Adjusted Fair Value driver.

Jemena is continually looking to improve its driver sets.

NAP & WD costs (formerly "JAM indirect regional and corporate costs")

JAM incurred operating costs in the provision of services, such as Regional Operations, Finance, Asset Services and Customer Services etc. These costs are allocated to each client contract by applying a cost allocation driver based on JAM's employee labour time spent within those indirect regional and corporate business units (FTE driver).

Indirect regional and corporate costs are captured by cost centres. Cost centres are generally aligned to organisational structure or contract.

3 Shared cost allocators

The WOBCA methodology was designed to allocate indirect costs occurring within JEM and JAM for the purpose of determining the underlying cost of providing services to each network asset or external client. The methodology uses a number of drivers, on a causal basis, dependent upon the nature of the cost being allocated.

In this context, causal relationship means that the relevant allocator is the best available proxy of consumption or utilisation of the resources or services represented by the costs (or other account item) that is being allocated. Once identified, the relevant cost allocator is applied to each cost item, as defined by the business unit or organisational view of the business.

All of these costs are generic corporate costs that are incurred for the benefit of the entire JEM Group. For instance, where Fair Value has been used as the allocator, Management considers that the most significant factor in the consumption or utilisation of these corporate costs is the relative importance of the Group's assets – that is, Management is likely to spend its time in proportion to the relative value of each asset.

The numeric quantity or percentage of the allocators identified is expected to vary throughout the regulatory control period, as the value of the relevant inputs change. For example, the FTE allocator used to allocate JAM's indirect regional and corporate costs is based on the percentage of employee time spent on each JAM client contract. This could change as the JAM labour force is employed across a diverse and growing client portfolio.

4 Shared costs allocation

These shared or indirect costs, once allocated to JEN, are then allocated between the services provided by JEN. The costs are allocated on their proportion of direct costs compared to total direct costs to split between Standard Control Services and Alternate Control & Other Services as per the CAM. The amount allocated to Alternate Control & Other Services is then allocated to Fee Based, Quoted, Public Lighting and Unregulated Services using revenue as the basis to mirror the allocation method used for indirect costs in the final 2010 JEN Distribution Determination.

During the roll-out phase of the AMI program, all AMI-related costs are outsourced and are being captured and reported separately from all other costs incurred by JEN. Under the AER's classification, AMI metering services are considered to be unregulated services for the 2011-2015 regulatory period. AMI did not receive any allocation of WOBCA for the period January-March 2012 since direct costs relating to AMI attracted a 6% mark-up.

However, due to the elimination of primary and secondary drivers, and the in-sourcing of all metering activities from 1 April 2012, direct costs associated with metering activities, like all other business activities, now attract an allocation of ESF costs in proportion to the management effort at relevant cost centre level.

JEN's explanatory notes:

1 Consistent with the format set out in other templates (e.g. Templates 6, 11 and 12), JEN reads Public Lighting in this template as the ACS public lighting rather than new public lighting (negotiated services).

2 The ACS Capex amount shown in Template 6 includes vehicle, mobile plant & equipment ($307k)which are excluded in this template as it is not feasible to allocate to individual Alternative Services.
The ACS Capex shown in Template 6 also includes $2.8M of Capital Recoverable works which are not listed in Template 19.

High Voltage Injection	5/05/2013	Electrical damage to a large number of customers' equipment following a High Voltage Injection into Lockheed-Boeing substation.	149	-	149	-	-	Yes
		Total actual cost of self insurance	**341**	**-**	**341**	**468**	**-**	

Table 2 Self insurance events with an incurred cost of less than $100 000 per event

Number of events	Costs of the events that relate to regulated assets	Costs covered by external funding	Costs that do not relate to regulated assets
208	226	0	0

Table 3 Total self insurance that relate to regulated assets

Total self insurance	**567**

Note: This section is not intended to reconcile with EBSS data

Table 1:

Event: Severe Hail Storm

Costs of $45k resulting from hail damage to the roof of the Broadmeadows Warehouse (Cool Drive) which caused asbestos fibres to be released inside the building along with water damage.
These costs form part of a claim submitted to the insurance company during CY12, but are actual costs incurred in CY13.
Total costs covered by external funding of $468k comprise actual cash receipts and expected cash to be collected at a future date.

	CY12	CY13	Life to Date
Costs incurred for this event	(1,965)	(45)	(2,010)
Insurance Refund	800	468	1,268
Insurance Excess	500	0	500
Expected Future Insurance Refund	(665)	423	(242)

Event: Low Voltage Injection

Costs of $148k resulting from electrical damage following a low voltage injection into Havelock-Cathart substation:
These costs represent claims yet to be submitted to the insurance company.
The insurance excess is $100,000.

Event: High Voltage Injection

Costs of $149k resulting from electrical damage following a high voltage injection into Lockheed-Boeing substation:
These costs represent claims yet to be submitted to the insurance company.
The insurance excess is $100,000.

Table 2:

A total cost of $226k of self insurance has been incurred for events of less than $100k per event occurring in 2013 with claims received and settlements paid as at 31 December 2013.

The 208 events mainly relate to damage to third party property and represent events based on trouble orders resulting in claims. Where there is no associated trouble order and there was still a settlement, this has been classed as a single event.
The network incidents causing the damage include:
- supply failure as a result of fallen tree branches, weather effects (e.g.. lightning, storm), animal/bird damage, pole fire or vandalism etc.
- voltage fluctuation due to electrical or mechanical failure resulting in asset or service failure etc.

Instructions
Please populate table 1 where the asset categories definitions differ from the "Asset Installation"' worksheet.
The definitions in table 1 are not limited or restricted. Please include additional definitions where necessary.
Median unit costs should be used. Where unit costs are not recorded at the asset category level - provide the best estimates of the unit cost using the cost allocation method outlined in table 1.
As a transitional measure, the unit cost may be based on a statistically significant annual sample of actual work orders at a 5% or better confidence interval.
Provide basis of allocation where applicable
AER expected expenditure ($2010) means bushfire related expenditure as approved under the AER Determination for 2011-15
AER expected expenditure ($2010) means ESL and non ESL, ESMS related expenditure as approved under the AER Determination for 2011-15
AER expected volumes means the bushfire related expenditure in volumes as submitted under the AER Determination for 2011-15 as well as approved by ESV.
AER expected volumes means the ESL and non ESL and ESMS related volumes as approved under the AER Determination for 2011-15

CPI applied to convert expenditure in real $2010 to nominal based on lagged September CPI index	1.0854

Table 1 Asset groups: Definitions, cost-allocation basis and methodology

Asset group	Category *i.e., bushfire, ESMS, ESL or non-ESL*	Definitions	Basis for allocation of cost to asset group
Planned non-preferred services replacements	ESMS	Non-preferred services are upgraded to current standards as a proactive replacement program and in conjunction with other work such as network augmentation, pole replacement, reconductoring and asset relocation	This program replaces overhead services based on condition. The cost is allocated to "Services" asset group.
Planned replacement of non-preferred services due to height	ESMS	As with other non-preferred services particular attention is paid to services that are below regulated heights and are prioritised based on the classification of the road and the height of the service at the kerb, point of attachment and centre of the road.	This is a program to replace overhead services based on code height requirements. The cost is allocated to "Services" asset group.
Removal of public lighting switchwire	ESMS	Remove out-of-service public lighting switchwire to eliminate hazards to line workers and the general public.	This is a dedicated project to remove the public lighting switchwire. This project has been reclassified to Opex and is not allocated to an asset group.
Replacement of existing SWER lines with 22kV overhead bare conductor	Bushfire	Convert existing Single Wire Earth Return (SWER) lines into 3-phase distribution network to improve sensitivity of electrical protection .	This is a dedicated project to replace existing Single Wire Earth Return (SWER) lines with 3-phase conductor. The cost is allocated to "Conductor" asset group.
Installation of GFN and associated equipment at zone substations	Bushfire	A GFN is a Ground Fault Neutraliser, also known as Rapid Earth Fault Current Limiter (REFCL), which is installed inside a zone substation and has the purpose of limiting earth fault current and reducing bushfire ignition risk.	This is a dedicated project to install GFN in zone substations supplying into the Hazardous Bushfire Risk Area (HBRA). The cost is allocated to "Zone - Other assets" asset group.
Replacement of crossarms/insulator sets – pole top fire mitigation	ESMS	Replace deteriorated pole top structures to reduce the risk of pole top fire ignition. The distribution feeders that have been targeted for pole fire mitigation were identified from detailed engineering analysis.	This is a dedicated program to replace pole top structures based on condition of pole tops. The cost is allocated to the "Pole Top Structures" asset group
Replacement of crossarms – based on age and condition	ESMS	The asset inspection program makes an assessment of the serviceability of crossarms based on condition. Crossarms are replaced when they are deemed to reach the end of their service life.	This is an inspection driven program to replace pole top structures based on condition. The cost is allocated to the "Pole Top Structures" asset group
Replacement of poles – based on age and condition	ESMS	Poles are replaced when they have reached the end of their service life and are unsuitable for staking.	This is an inspection and test driven program to replace poles based on the findings. The cost is allocated to the "Poles" asset group.
Stake poles – based on age and condition	ESMS	The pole inspection program uses a technical measurement procedure to determine the serviceability of wood poles. Poles are staked to reinforce their strength if their condition has deteriorated but could remain in service after reinforcement.	This is an inspection and test driven program to stake poles based on the findings. The cost is allocated to the "Poles" asset group and sub-group of "Staked Poles".
Replacement of undersized poles	ESMS	Replace undersized poles which could not be reinforced by staking as these poles have sub-standard strength (typically 5kN or less) and have a history of failure in severe wind storms.	This is a dedicated program to identify and replace undersized poles if not suitable for staking. The cost is allocated to the "Poles" asset group.
Stake undersized poles	ESMS	Reinforce undersized poles by staking as these poles have sub-standard strength (typically 5kN or less) and have a history of failure in severe wind storms.	This is a dedicated program to identify and stake undersized poles if suitable. The cost is allocated to the "Poles" asset group and sub-group of "Staked Poles".
Replacement of overhead conductor – mainly steel	Bushfire	Replace overhead conductors in the HBRA based on condition.	This is a dedicated program to replace overhead conductor in the HBRA based on condition. The cost is allocated to the "conductor" asset group.
Service line clearance – overhead services requiring relocation	ESMS	Replace overhead services where it is not economical or feasible to cut back the vegetation to meet the new Electricity Safety (Electric Line Clearance) Regulations 2010.	This is a dedicated program to replace overhead services where it is not economical or feasible to cut back the vegetation to meet code requirements. The cost is allocated to "Services" asset group.
Service line clearance – overhead services requiring undergrounding	ESMS	Underground overhead services where it is not economical or feasible to cut back the vegetation to meet the new Electricity Safety (Electric Line Clearance) Regulations 2010.	This is a dedicated program to replace overhead services with underground services where it is not economical or feasible to cut back the vegetation to meet code requirements. The cost is allocated to "Service"s asset group.
Replacement of SWER with ABC/underground cabling	ESMS	-	JEN did not propose replacement of SWER with ABC/underground cabling.
Replacement of 22kV distribution feeders with ABC/underground cabling	ESMS	-	JEN did not propose replacement of 22kV distribution feeders with ABC/underground cabling.
Distribution Transformer Height Rectification	ESMS	To modify mounting arrangement to ensure the pole top distribution transformer heights meet code requirements.	This is a dedicated program to ensure the pole top distribution transformer heights meet code requirements . The cost is allocated to the "Distribution Others" asset group.
Vibration Dampers	Bushfire	To install Vibration Dampers in the Hazardous Bushfire Risk Area (HBRA). This is an ESV directive from the Bushfire Royal Commission recommendation.	This is a dedicated program to install Vibration Dampers in the Hazardous Bushfire Risk Area (HBRA). The cost is allocated to "Conductor" asset group.
Armour Rods	Bushfire	To install Armour Rods in the Hazardous Bushfire Risk Area (HBRA). This is an ESV directive from the Bushfire Royal Commission recommendation.	This is a dedicated program to install Armour Rods in the Hazardous Bushfire Risk Area (HBRA). The cost is allocated to "Conductor" asset group.
Zone Substation Earth Grid replacements	ESMS	To identify, test and replace zone substation earth grids to ensure they meet safety requirements.	This is a dedicated program to identify, test and replace zone substation earth grids. The cost is allocated to "Zone-Other Assets" asset group.
Trial of Neutral Condition Monitor	ESMS	AER approved an opex step change for the trial of neutral condition monitors. JEN has instead invested in a capex program "Customer Supply Monitoring" (CSM) to provide neutral condition monitoring.	This is a project to trial the use of the smart meter to monitor the condition of the services line. The cost is allocated to "Others" asset group.

Table 2 Bushfire related expenditure (volumes)

Asset group	Units	AER expected volumes	Actual Units	Variance	Reasons for variance
Planned non-preferred services replacements	no. of services	-	-	-	-
Planned replacement of non-preferred services due to height	no. of services	-	-	-	-
Removal of public lighting switchwire	no. of spans removed	-	-	-	-
Replacement of existing SWER lines with 22kV overhead bare conductor	no. of kms of SWER	3	14	(11)	JEN has completed the program ahead of schedule. All SWER has been removed from the JEN network as of February 2013.
Installation of GFN and associated equipment at zone substations	no. of zone substations	1	-	1	JEN plans to complete a trial installation of a REFCL (Rapid Earth Fault Current Limiter) in this 5-year period. Cost incurred in 2013 is associated with the request for tender process that has been undertaken.
Replacement of crossarms/insulator sets – pole top fire mitigation	no. of crossarms/sets	-	-	-	-
Replacement of crossarms – based on age and condition	no. of crossarms	-	-	-	-
Replacement of poles – based on age and condition	no. of poles	-	-	-	-
Stake poles – based on age and condition	no. of poles	-	-	-	-
Replacement of undersized poles	no. of poles	-	-	-	-
Stake undersized poles	no. of poles	-	-	-	-
Replacement of overhead conductor – mainly steel	no. of kms	22	12	10	JEN is ahead of target with the steel conductor replacement program in the Hazardous Bushfire Risk Area (HBRA) for the 3 year period (2011 to 2013).
Service line clearance – overhead services requiring relocation	no. of services	-	-	-	-
Service line clearance – overhead services requiring undergrounding	no. of services	-	-	-	-
Replacement of SWER with ABC/underground cabling	no. of km	-	-	-	JEN did not propose replacement of SWER with ABC/underground cabling.
Replacement of 22kV distribution feeders with ABC/underground cabling	no. of feeders	-	-	-	JEN did not propose replacement of 22kV distribution feeders with ABC/underground cabling.
Vibration Dampers	no. of spans	-	390	(390)	This is an ESV directive which was a part of the Victorian Bushfires Royal Commission recommendation. This directive was given post Revised EDPR submission. This program is on target to be completed in 2014.
Armour Rods	no. of sets	-	76	(76)	This is an ESV directive which was a part of the Victorian Bushfires Royal Commission recommendation. This directive was given post Revised EDPR submission. This program is on target to be completed in 2014.

Table 3 Safety related other - ESL, non ESL and ESMS (volumes)

Asset group	Units	AER expected volumes	Actual Units	Variance	Reasons for variance
Planned non-preferred services replacements	no. of services	6,000	4,615	1,385	JEN has replaced 4,615 non-preferred services in 2013. JEN has identified the specific services that will be targeted for replacement and is well advanced with the associated works planning in order to achieve the obligation over the 5 year period.
Planned replacement of non-preferred services due to height	no. of services	341	1,735	(1,394)	JEN has replaced 1,735 non-preferred services due to height in 2013. JEN has identified the specific services that will be targeted for replacement and is well advanced with the associated works planning in order to achieve the obligation over the 5 year period.
Removal of public lighting switchwire	no. of spans removed	1,700	2,077	(377)	JEN has exceeded the annual target and is on target to achieve the 5 year target.
Replacement of existing SWER lines with 22kV overhead bare conductor	no. of kms of SWER	-	-	-	-
Installation of GFN and associated equipment at zone substations	no. of zone substations	-	-	-	-
Replacement of crossarms/insulator sets – pole top fire mitigation	no. of crossarms/sets	567	314	253	JEN identified and replaced 314 crossarms/insulator sets in the targeted pole fire mitigation area in 2013. JEN is on target to achieve the 5 year target.
Replacement of crossarms – based on age and condition	no. of crossarms	2,823	4,098	(1,275)	JEN is on track to deliver the AER's approved volume in the 5-year period. In 2013 JEN continued to inspect assets in accordance with the Asset Inspection Manual and replace crossarms based on condition. The number of crossarms replaced due to age and condition can be initiated by network augmentation activities and is not limited to asset replacement activities.
Replacement of poles – based on age and condition	no. of poles	259	395	(136)	JEN is on track to deliver the AER's approved volume in the 5-year period. In 2013 JEN continued to inspect assets in accordance with the Asset Inspection Manual and replace poles based on condition. The number of poles replaced due to age and condition can be initiated by network augmentation activities and is not limited to asset replacement activities.
Stake poles – based on age and condition	no. of poles	223	405	(182)	JEN is on track to deliver the AER's approved volume in the 5-year period. In 2013 JEN continued to inspect assets in accordance with the Asset Inspection Manual and to stake poles based on condition.
Replacement of undersized poles	no. of poles	277	75	202	In 2013, JEN replaced 75 undersized poles and performed the necessary design for the replacement of additional undersized poles. The design has identified a higher number of undersized poles being suitable for staking, therefore reducing the number of poles that will be replaced in 2014. When the total volume of undersized poles that have been replaced and staked is considered, the two programs to address undersized poles is ahead of target.
Stake undersized poles	no. of poles	220	702	(482)	JEN is on track to deliver the AER's approved volume in the 5-year period.
Replacement of overhead conductor – mainly steel	no. of kms	-	-	-	-
Service line clearance – overhead services requiring relocation	no. of services	57	48	9	This activity is focussed on achieving compliance to the 2010 Electric Line Clearance Regulations. Under this activity category it was identified that the bulk of work was required on LV mains. As such, in 2013, JEN has relocated 48 services and have replaced 1 pole, offset 2 crossarms and replaced 2 bays of LV with 35mm service cable.
Service line clearance – overhead services requiring undergrounding	no. of services	14	-	14	In 2013 JEN completed the works described above. There has not been a requirement to underground any services in order to achieve compliance.
Replacement of SWER with ABC/underground cabling	no. of km	-	-	-	JEN did not propose replacement of SWER with ABC/underground cabling.
Replacement of 22kV distribution feeders with ABC/underground cabling	no. of feeders	-	-	-	JEN did not propose replacement of 22kV distribution feeders with ABC/underground cabling.
Distribution Transformer Height Rectification	no. of Distribution Transformers	-	-	-	The AER has not explicitly provided for this program of works in its final determination
Zone Substation Earth Grid replacements	no. of Zone Substation	-	-	-	The AER has not explicitly provided for this program of works in its final determination
Trial of Neutral Condition Monitor	no. of customers	5,000	-	5,000	JEN has not progressed this project in 2013 due to inability to source a commercial product for the trial.

Table 4 Bushfire related expenditure ($ nominal - excluding margins and overheads)

Asset group	Category	AER expected expenditure ($'000 2010)	Actual ($'000 nominal)	Variance ($'000 nominal)	Reasons for variance
Planned non-preferred services replacements		-	-	-	-
Planned replacement of non-preferred services due to height	0	-	-	-	-
Removal of public lighting switchwire	0	-	-	-	-
Replacement of existing SWER lines with 22kV overhead bare conductor	Bushfire	461	1,842	(1,342)	The construction work commenced in late December 2012 and was completed in 2013.
Installation of GFN and associated equipment at zone substations	Bushfire	875	21	929	JEN plans to complete a trial installation of a REFCL (Rapid Earth Fault Current Limiter) in this 5-year period. Cost incurred in 2013 is associated with the request for tender process that has been undertaken.
Replacement of crossarms/insulator sets – pole top fire mitigation	0	-	-	-	-
Replacement of crossarms – based on age and condition	0	-	-	-	-
Replacement of poles – based on age and condition	0	-	-	-	-
Stake poles – based on age and condition	0	-	-	-	-
Replacement of undersized poles	0	-	-	-	-
Stake undersized poles	0	-	-	-	-
Replacement of overhead conductor – mainly steel	Bushfire	1,248	484	870	JEN identified fewer km of conductor in 2013 that require replacement than forecast, however JEN is ahead of target with the steel conductor replacement program in the Hazardous Bushfire Risk Area (HBRA) for the 3 year period (2011 to 2013).
Service line clearance – overhead services requiring relocation	0	-	-	-	-
Service line clearance – overhead services requiring undergrounding	0	-	-	-	-
Replacement of SWER with ABC/underground cabling	0	-	-	-	JEN did not propose replacement of SWER with ABC/underground cabling.
Replacement of 22kV distribution feeders with ABC/underground cabling	0	-	-	-	JEN did not propose replacement of 22kV distribution feeders with ABC/underground cabling.
Vibration Dampers	Bushfire	-	234	(234)	This is an ESV directive which was a part of the Victorian Bushfires Royal Commission recommendation. This directive was given post Revised EDPR submission. The cost for Vibration Damper and Armour Rod are collected as one project, JEN is unable to separate these costs.
Armour Rods	Bushfire	-	-	-	This is an ESV directive which was a part of the Victorian Bushfires Royal Commission recommendation. This directive was given post Revised EDPR submission. The cost for Vibration Damper and Armour Rod are collected as one project, JEN is unable to separate these costs.

Note - Reported expenditure is to be entered EXCLUSIVE of any overheads, profit margins or management fees paid directly or indirectly to related party contractors for the report period.

Table 5 Safety related other - ESL, non ESL and ESMS ($ nominal - excluding margins and overheads)

Asset group	Category	AER expected expenditure ($'000 2010)	Actual ($'000 nominal)	Variance ($'000 nominal)	Reasons for variance
Planned non-preferred services replacements	ESMS	1,823	4,407	(2,429)	Although JEN has replaced 6,350 non-preferred services in 2013, which is on target with a forecast volume of 6341, the cost of the program is greater than the expected expenditure. This is a result of the unit rate being higher than the allowance.
Planned replacement of non-preferred services due to height	ESMS	104	-	112	JEN is unable to report on the actual cost (and volumes) for this item separately in 2013 as the data is not collected separately. The cost is included in the above item.
Removal of public lighting switchwire	ESMS	306	467	(134)	JEN commenced the first year of the targeted removal program in 2012 as planned and the program continued throughout 2013. The cost is higher than forecast as a result of the higher volume being completed.
Replacement of existing SWER lines with 22kV overhead bare conductor	0	-	-	-	-
Installation of GFN and associated equipment at zone substations	0	-	-	-	-
Replacement of crossarms/insulator sets – pole top fire mitigation	ESMS	1,372	1,036	453	JEN identified and replaced 314 crossarms/insulator sets in the targeted pole fire mitigation area in 2013 compared with a target of 567. JEN is on track to meet its 5 year target.
Replacement of crossarms – based on age and condition	ESMS	5,292	2,614	3,130	In 2013 JEN continued to inspect assets in accordance with the Asset Inspection Manual and replace crossarms based on condition. The number of crossarms replaced due to age and condition can be initiated by network augmentation activities and is not limited to asset replacement activities. Replacing crossarms as part of a network augmentation project will result in the cost of the crossarm replacement being captured as part of the network augmentation project and is unable to be separately identified. Therefore, the total expenditure shown is not representative of the replacement volume shown above.
Replacement of poles – based on age and condition	ESMS	1,288	2,910	(1,512)	JEN identified 395 poles that required replacement in 2013 compared with a seasonalised forecast of 259 poles. The actual unit rate was higher than the allowance. The number of poles replaced due to age and condition can be initiated by network augmentation activities and is not limited to asset replacement activities. Replacing poles as part of a network augmentation project will result in the cost of the pole replacement being captured as part of the network augmentation project and is unable to be separately identified. Therefore, the total expenditure shown is not representative of the replacement volume shown above.
Stake poles – based on age and condition	ESMS	164	535	(357)	JEN identified and staked 405 poles in 2013 compared with a seasonalised forecast of 223 poles. The actual unit rate was higher than the allowance.
Replacement of undersized poles	ESMS	1,265	791	582	In 2013, JEN replaced 75 undersized poles and performed the necessary design for the replacement of additional undersized poles. The design has identified a higher number of undersized poles being suitable for staking, therefore reducing the cost of poles that will be replaced in 2013.
Stake undersized poles	ESMS	161	882	(707)	In 2013, JEN staked 702 undersized poles. A portion of the cost incurred in 2013 was due to undersized poles that were staked in late 2012.
Replacement of overhead conductor – mainly steel	0	-	-	-	-
Service line clearance – overhead services requiring relocation	ESMS	17	93	(74)	This activity is focussed on achieving compliance to the 2010 Electric Line Clearance Regulations. Under this activity category it was identified that a portion of the work was required on LV mains. As such, in 2013, JEN has relocated 48 services, replaced 1 pole, installed 2 offset crossarms and replaced 2 bays of LV with 35mm service cable.
Service line clearance – overhead services requiring undergrounding	ESMS	71	-	77	In 2013 JEN completed the works described above. There has not been a requirement to underground any services in order to achieve compliance.
Replacement of SWER with ABC/underground cabling	0	-	-	-	JEN did not propose replacement of SWER with ABC/underground cabling.
Replacement of 22kV distribution feeders with ABC/underground cabling	0	-	-	-	JEN did not propose replacement of 22kV distribution feeders with ABC/underground cabling.
Distribution Transformer Height Rectification	ESMS	-	78	(78)	The AER has not explicitly provided for this program of works in its final determination
Zone Substation Earth Grid replacements	ESMS	-	194	(194)	The AER has not explicitly provided for this program of works in its final determination
Trial of Neutral Condition Monitor	ESMS	-	-	-	JEN has not progressed this project in 2013 due to inability to source a commercial product for the trial.

Note - Reported expenditure is to be entered EXCLUSIVE of any overheads, profit margins or management fees paid directly or indirectly to related party contractors for the report period.

Table 6 Bushfire related expenditure ($ nominal - margins and overheads)

Asset group	Category	AER expected expenditure ($'000 2010)	Actual ($'000 nominal)	Variance ($'000 nominal)	Reasons for variance
Planned non-preferred services replacements	0	-	-	-	-
Planned replacement of non-preferred services due to height	0	-	-	-	-
Removal of public lighting switchwire	0	-	-	-	-
Replacement of existing SWER lines with 22kV overhead bare conductor	Bushfire	26	297	(268)	As per Table 4
Installation of GFN and associated equipment at zone substations	Bushfire	50	3	51	As per Table 4
Replacement of crossarms/insulator sets – pole top fire mitigation	0	-	-	-	-
Replacement of crossarms – based on age and condition	0	-	-	-	-
Replacement of poles – based on age and condition	0	-	-	-	-
Stake poles – based on age and condition	0	-	-	-	-
Replacement of undersized poles	0	-	-	-	-
Stake undersized poles	0	-	-	-	-
Replacement of overhead conductor – mainly steel	Bushfire	72	78	(0)	As per Table 4
Service line clearance – overhead services requiring relocation	0	-	-	-	-
Service line clearance – overhead services requiring undergrounding	0	-	-	-	-
Replacement of SWER with ABC/underground cabling	0	-	-	-	-
Replacement of 22kV distribution feeders with ABC/underground cabling	0	-	-	-	-
Vibration Dampers	Bushfire	-	38	(38)	As per Table 4
Armour Rods	Bushfire	-	-	-	As per Table 4

Note -Reported expenditure to be entered is the sum of overheads, profit margins or management fees paid directly or indirectly to related party contractors for the report period.

Table 7 Safety related other - ESL, non ESL and ESMS ($ nominal - margins and overheads)

Asset group	Category	AER expected expenditure ($'000 2010)	Actual ($'000 nominal)	Variance ($'000 nominal)	Reasons for variance
Planned non-preferred services replacements	ESMS	105	710	(597)	As per Table 5
Planned replacement of non-preferred services due to height	ESMS	6	-	6	As per Table 5
Removal of public lighting switchwire	ESMS	18	75	(56)	As per Table 5
Replacement of existing SWER lines with 22kV overhead bare conductor		-	-	-	-
Installation of GFN and associated equipment at zone substations		-	-	-	-
Replacement of crossarms/insulator sets – pole top fire mitigation	ESMS	79	167	(81)	As per Table 5
Replacement of crossarms – based on age and condition	ESMS	304	421	(91)	As per Table 5
Replacement of poles – based on age and condition	ESMS	74	469	(389)	As per Table 5
Stake poles – based on age and condition	ESMS	9	86	(76)	As per Table 5
Replacement of undersized poles	ESMS	73	128	(49)	As per Table 5
Stake undersized poles	ESMS	9	142	(132)	As per Table 5
Replacement of overhead conductor – mainly steel		-	-	-	-
Service line clearance – overhead services requiring relocation	ESMS	1	15	(14)	As per Table 5
Service line clearance – overhead services requiring undergrounding	ESMS	4	-	4	As per Table 5
Replacement of SWER with ABC/underground cabling		-	-	-	-
Replacement of 22kV distribution feeders with ABC/underground cabling		-	-	-	-
Distribution Transformer Height Rectification	ESMS	-	13	(13)	As per Table 5
Zone Substation Earth Grid replacements	ESMS	-	31	(31)	As per Table 5
Trial of Neutral Condition Monitor	ESMS	-	-	-	As per Table 5

Note -Reported expenditure to be entered is the sum of overheads, profit margins or management fees paid directly or indirectly to related party contractors for the report period.

Table 8 Bushfire related expenditure ($ unit cost)

Asset group	Category	AER expected expenditure ($'000 2010)	Actual ($'000 nominal)	Variance ($'000 nominal)	Reasons for variance
Planned non-preferred services replacements		0	0	-	-
Planned replacement of non-preferred services due to height		0	0	-	-
Removal of public lighting switchwire		0	0	-	-
Replacement of existing SWER lines with 22kV overhead bare conductor	Bushfire	[redacted]		-	Construction work was completed in 2013. The majority of the cost incurred in 2013 was for construction works. Cost for design, community consultation and initiation phase of the project were incurred in prior years.
Installation of GFN and associated equipment at zone substations	Bushfire			-	No actual unit rate. Construction work is planned to commence in 2015.
Replacement of crossarms/insulator sets – pole top fire mitigation		0	0	-	-
Replacement of crossarms – based on age and condition		0	0	-	-
Replacement of poles – based on age and condition		0	0	-	-
Stake poles – based on age and condition		0	0	-	-
Replacement of undersized poles		0	0	-	-
Stake undersized poles		0	0	-	-
Replacement of overhead conductor – mainly steel	Bushfire	[redacted]		20	The actual unit rate is the total project cost of conductor replacement, inclusive of the cost of pole top structures that require replacement at the time. The unit rate will vary depending on the complexity of the specific project and the length of the conductor replacement. Higher proportion of longer length projects has been experienced in 2013 resulting in more efficient project delivery.
Service line clearance – overhead services requiring relocation		0	0	-	-
Service line clearance – overhead services requiring undergrounding		0	0	-	-
Replacement of SWER with ABC/underground cabling		0	0	-	JEN did not propose replacement of SWER with ABC/underground cabling.
Replacement of 22kV distribution feeders with ABC/underground cabling		0	0	-	JEN did not propose replacement of 22kV distribution feeders with ABC/underground cabling.
Vibration Dampers	Bushfire	[redacted]			This is an ESV directive which was a part of the Victorian Bushfires Royal Commission recommendation. This directive was given post Revised EDPR submission.
Armour Rods	Bushfire				This is an ESV directive which was a part of the Victorian Bushfires Royal Commission recommendation. This directive was given post Revised EDPR submission.

Table 9 Safety related other - ESL, non ESL and ESMS ($ unit cost)

Asset group	Category	AER expected expenditure ($'000 2010)	Actual ($'000 nominal)	Variance ($'000 nominal)	Reasons for variance
Planned non-preferred services replacements	ESMS	[redacted]	[redacted]	(1)	This unit rate is the average rate to replace services. JEN is unable to report on the unit rates separately for this category and replacements due to height in 2013 as the data is not collected separately.
Planned replacement of non-preferred services due to height	ESMS	[redacted]	[redacted]	(1)	This unit rate is the average rate to replace services. JEN is unable to report on the unit rates separately for this category and replacements due to height in 2013 as the data is not collected separately.
Removal of public lighting switchwire	ESMS	[redacted]	[redacted]	(0)	The unit rate reduced as expected in 2013 compared with 2012 as a result of completing a larger volume of removals in 2013. The unit rate is higher than forecast because the project cost includes the surveying of the network to identify the switchwire locations.
Replacement of existing SWER lines with 22kV overhead bare conductor		0	0	-	-
Installation of GFN and associated equipment at zone substations		0	0	-	-
Replacement of crossarms/insulator sets – pole top fire mitigation	ESMS	[redacted]	[redacted]	(1)	The actual unit rate varies depending on the proportion of complex pole top structures that were completed in 2013.
Replacement of crossarms – based on age and condition	ESMS	[redacted]	[redacted]	(1)	The number of crossarms replaced due to age and condition can be initiated by network augmentation activities and is not limited to asset replacement activities. Replacing crossarms as part of a network augmentation project will result in the cost of the crossarm replacement being captured as part of the network augmentation project and is unable to be separately identified. Therefore, the actual unit cost shown is based on detailed examination of a number of replacement work orders undertaken in 2013.
Replacement of poles – based on age and condition	ESMS	[redacted]	[redacted]	(8)	The number of poles replaced due to age and condition can be initiated by network augmentation activities and is not limited to asset replacement activities. Replacing poles as part of a network augmentation project will result in the cost of the pole replacement being captured as part of the network augmentation project and is unable to be separately identified. Therefore, the actual unit cost shown is based on detailed examination of a number of replacement work orders undertaken in 2013. The actual unit rate will vary depending on the ratio of subtransmission, high voltage, low voltage and public lighting poles that require replacement. This means that if there is a high proportion of complex poles, particularly high voltage, the unit rate will be higher than forecast. Higher proportion of complex pole structures has been experienced in 2013.
Stake poles – based on age and condition	ESMS	[redacted]	[redacted]	(1)	The actual unit rate will vary depending on the strength of the poles and this, in general is related to the ratio of subtransmission, high voltage, low voltage and public lighting poles that require staking. This means that if there is a higher than forecast proportion of high voltage poles to be staked then the unit rate will be higher than forecast. Higher proportion of high voltage poles has been staked in 2013.
Replacement of undersized poles	ESMS	[redacted]	[redacted]	-	The actual unit rate will vary depending on the ratio of subtransmission, high voltage, low voltage and public lighting poles that require replacement. This means that if there is a high proportion of complex poles, particularly high voltage, the unit rate will be higher than forecast. Higher proportion of complex pole structures has been experienced in 2013.
Stake undersized poles	ESMS	[redacted]	[redacted]	-	The actual unit rate will vary depending on the strength of the poles and this, in general is related to the ratio of subtransmission, high voltage, low voltage and public lighting poles that require staking. This means that if there is a higher than forecast proportion of high voltage poles to be staked then the unit rate will be higher than forecast. Higher proportion of high voltage poles has been staked in 2013.
Replacement of overhead conductor – mainly steel		0	0	-	-
Service line clearance – overhead services requiring relocation	ESMS	[redacted]	[redacted]	-	To ensure compliance it has been necessary for JEN to relocate and replace assets other than overhead services. In 2013, JEN has relocated 48 services, replaced 1 pole, installed 2 offset crossarms and replaced 2 bays of LV with 35mm service cable. The relocation and replacement work will continue throughout 2014.
Service line clearance – overhead services requiring undergrounding	ESMS	[redacted]	[redacted]	-	In 2013 JEN completed the works described above. There has not been a requirement to underground any services in order to achieve compliance.
Replacement of SWER with ABC/underground cabling		0	0	-	JEN did not propose replacement of SWER with ABC/underground cabling.
Replacement of 22kV distribution feeders with ABC/underground cabling		0	0	-	JEN did not propose replacement of 22kV distribution feeders with ABC/underground cabling.
Distribution Transformer Height Rectification	ESMS	[redacted]	[redacted]	#VALUE!	This unit rate was not calculated for 2013 as the cost incurred was for further survey and design work.
Zone Substation Earth Grid replacements	ESMS	[redacted]	[redacted]	(49)	The actual unit rate will vary depending on the degree of complexity associated with the works required to achieve the earth grid requirements. This unit rate is based on average cost per work site performed during 2013.
Trial of Neutral Condition Monitor	ESMS	[redacted]	[redacted]	-	JEN has not progressed this project in 2013 due to inability to source a commercial product for the trial.

Table 10 Safety improvement outcomes reported to ESV (volumes)

Asset group	Units	Safety Improvement Programme - outcomes	Safety Improvement Target	Variance	Reasons for variance
Planned non-preferred services replacements	no. of services	4,615	6,000	(1,385)	As per Table 3
Planned replacement of non-preferred services due to height	no. of services	1,735	341	1,394	As per Table 3
Removal of public lighting switchwire	no. of spans removed	2,077	1,700	377	As per Table 3
Replacement of existing SWER lines with 22kV overhead bare conductor	no. of kms of SWER	14	3	11	As per Table 2
Installation of GFN and associated equipment at zone substations	no. of zone substations	-	1	(1)	As per Table 2
Replacement of crossarms/insulator sets – pole top fire mitigation	no. of crossarms/sets	314	567	(253)	As per Table 3
Replacement of crossarms – based on age and condition	no. of crossarms	4,098	2,823	1,275	As per Table 3
Replacement of poles – based on age and condition	no. of poles	395	259	136	As per Table 3
Stake poles – based on age and condition	no. of poles	405	223	182	As per Table 3
Replacement of undersized poles	no. of poles	75	277	(202)	As per Table 3
Stake undersized poles	no. of poles	702	220	482	As per Table 3
Replacement of overhead conductor – mainly steel	no. of kms	12	22	(10)	As per Table 2
Service line clearance – overhead services requiring relocation	no. of services	48	57	(9)	As per Table 3
Service line clearance – overhead services requiring undergrounding	no. of services	-	14	(14)	As per Table 3
Replacement of SWER with ABC/underground cabling	no. of km	-	-	-	As per Table 3
Replacement of 22kV distribution feeders with ABC/underground cabling	no. of feeders	-	-	-	As per Table 3
Distribution Transformer Height Rectification	no. of Distribution Transformers	-	-	-	As per Table 3
Vibration Dampers	no. of spans	390	-	390	As per Table 2
Armour Rods	no. of sets	76	-	76	As per Table 2
Zone Substation Earth Grid replacements	no. of Zone Substation	-	-	-	As per Table 3
Trial of Neutral Condition Monitor	no. of customers	-	5,000	(5,000)	As per Table 3

Table 11 Reconciliation of safety improvement outcomes reported to ESV and AER (volumes)

Asset group	Units	Variance	Reasons for variance
Planned non-preferred services replacements	no. of services	1,385	As per Table 3
Planned replacement of non-preferred services due to height	no. of services	(1,394)	As per Table 3
Removal of public lighting switchwire	no. of spans removed	(377)	As per Table 3
Replacement of existing SWER lines with 22kV overhead bare conductor	no. of kms of SWER	(11)	As per Table 2
Installation of GFN and associated equipment at zone substations	no. of zone substations	1	As per Table 2
Replacement of crossarms/insulator sets – pole top fire mitigation	no. of crossarms/sets	253	As per Table 3
Replacement of crossarms – based on age and condition	no. of crossarms	(1,275)	As per Table 3
Replacement of poles – based on age and condition	no. of poles	(136)	As per Table 3
Stake poles – based on age and condition	no. of poles	(182)	As per Table 3
Replacement of undersized poles	no. of poles	202	As per Table 3
Stake undersized poles	no. of poles	(482)	As per Table 3
Replacement of overhead conductor – mainly steel	no. of kms	10	As per Table 2
Service line clearance – overhead services requiring relocation	no. of services	9	As per Table 3
Service line clearance – overhead services requiring undergrounding	no. of services	14	As per Table 3
Replacement of SWER with ABC/underground cabling	no. of km	-	As per Table 3
Replacement of 22kV distribution feeders with ABC/underground cabling	no. of feeders	-	As per Table 3
Distribution Transformer Height Rectification	no. of Distribution Transformers	-	As per Table 3
Vibration Dampers	no. of spans	(390)	As per Table 2
Armour Rods	no. of spans	(76)	As per Table 2
Zone Substation Earth Grid replacements	no. of Zone Substation	-	As per Table 3
Trial of Neutral Condition Monitor	no. of customers	5,000	As per Table 3

JEN's explanatory notes:

1 Tables 12 - 14

These three tables are not applicable as JEN did not have any pass-through applications for 2013.

2 Unit rate information (both AER determination and actual) is confidential to JEN because public disclosure could jeopardise JEN's commercial position in future negotiations with prospective service providers. This applies to all unit rate data.

Distribution Network Service Provider
Annual reporting template

This template is to be used by a DNSP to fulfil its annual reporting obligations to the AER.

Colour coding of input sheets:
Dark blue = AER instructions/headings
Yellow = Input cells
Grey - Not applicable/No inputs required

Leave coloured cells blank if no information exists - PLEASE DO NOT ENTER TEXT unless specifically requested to do so.
All dollar amounts are to be unrounded, and in nominal terms.

DNSP - trading name:	**Jemena Electricity Networks (Vic) Limited**

Table 5: Average distribution customer numbers

	CBD	Urban	Rural short	Rural long	Whole network
Customer numbers at the start of period		306,645	12,721		319,366
Customer numbers at the end of period		305,483	12,811		318,294
Average distribution customer numbers	0	306,064	12,766	0	318,830

Note - the AER's *Electricity distribution network service providers, Service target performance incentive scheme* , November 2009, p. 22, defines SAIDI and SAIFI as follows;
1) Unplanned SAIDI - The sum of the duration of each unplanned sustained customer interruption (in minutes) divided by the total number of distribution customers. Unplanned SAIDI excludes

2) Unplanned SAIFI - The total number of unplanned sustained customer interruptions divided by the total number of distribution customers. Unplanned SAIFI excludes momentary interruptions (one The AER will apply the ESCV's definition of MAIFI for transitional reasons. The ESCV's Information specification (Service performance) for Victorian Electricity Distributors, 1 January 2009, p. 30,
3) MAIFI - The total number of momentary interruptions divided by the total number of distribution customers (where the distribution customers are network or per feeder based, as appropriate).
4) Total includes the impact of excluded events and MED.

STPIS Data Reporting - AER Definitions
2013
Customer service

Table 1: Telephone answering

Telephone answering	Total	Total after removing MED
Number of calls received	76,248	74,599
Number of calls answered within 30 seconds	47,151	46,960
Percentage of calls answered within 30 seconds	61.84%	62.95%

Note:
Telephone answering has the same meaning as defined in the Electricity DNSPs' STPIS, November 2009.

Table 2: New connections

Note: This is for newly energised properties only

New connections	Total
Number of new connections	7,409
Number of new connections not provided on or before the agreed date	5
Percentage of new connections not provided on or before the agreed date	0.07%

Table 3: Streetlight repair

Note:
Streetlight repair has the same meaning as defined in the Electricity DNSPs' STPIS, November 2009

Streetlight repair	Total
Total number of streetlights	69,058
Total number of streetlight faults	3,054
Total number of streetlight faults reported by person who is the occupier of an immediately neighbouring residence or is the proprietor of an immediately neighbouring business	952
Faulty streetlights not repaired within 2 business days of fault report or agreed date	2
Percentage of faulty streetlights not repaired within 2 business days of fault report or agreed date	0.07%

Table 4 Guaranteed service levels - jurisdictional GSL scheme

Appointments (excluding AMI)	
Customer arranged appointments Central - number	3,629
Appointments not met within 15 minutes of agreed time - number	22
Appointments - GSL payments - number	22
Appointments - GSL payments - ($)	$ 440.00
Appointments (AMI only)	
Customer arranged appointments Central - number	32,588
Appointments not met within 15 minutes of agreed time - number	1,180
Appointments - GSL payments - number	1,180
Appointments - GSL payments - ($)	$ 23,600.00
Connections	
Connections made	7,409
Connections not made on agreed date	5
Connections - GSL payments - 1-4 day delay - number	3
Connections - GSL payments - 1-4 day delay - ($)	$ 250.00
Connections - GSL payments - 5+ day delay - number	2
Connections - GSL payments - 5+ day delay - ($)	$ 500.00
Reliability of supply	
Low reliability payments - 20 hours - number	340
Low reliability payments - 20 hours - ($)	$ 34,000.00
Low reliability payments - 30 hours - number	28
Low reliability payments - 30 hours - ($)	$ 4,200.00
Low reliability payments - 60 hours - number	0
Low reliability payments - 60 hours - ($)	$ -
Low reliability payments - 10 events - number	0
Low reliability payments - 10 events - ($)	$ -
Low reliability payments - 15 events - number	0
Low reliability payments - 15 events - ($)	$ -
Low reliability payments - 30 events - number	0
Low reliability payments - 30 events - ($)	$ -
Low reliability payments - 24 momentary events - number	0
Low reliability payments - 24 momentary events - ($)	$ -
Low reliability payments - 36 momentary events - number	0
Low reliability payments - 36 momentary events - ($)	$ -
Street lights	
Street lights	69,058
Street lights "out" during period	3,054
Street lights not repaired by "fix by" date	4
Street lights not repaired in 2 business days	1,568
Street lights – number of business days to repair	3.3
Street lights - GSL payments - number	2
Street lights - GSL payments - ($)	$ 20.00
Planned interruptions	
Planned interruptions - 4 business days notice not given	61
Total GSL payments made ($)	$ 63,010.00

Jemena Electricity Networks (Vic) Limited
STPIS Data Reporting
2013
Daily Performance Data

Instruction

This regulatory template requires the input of historical daily performance recorded for the calculation of the parameters under the STPIS, such as MED day boundary and performance targets. STPIS definitions apply to SAIDI and Calls not answered within 30 seconds.
Please note: The AER's definition of calls answered within 30 seconds is as follows:
Calls to the fault line answered in 30 seconds where the time to answer a call is measured from when the call enters the telephone system of the call centre (including that time when it may be ringing unanswered by any response) and the caller speaks with a human operator, but excluding the time that the caller is connected to an automated interactive service that provides substantive information. This measure does not apply to:
- calls to payment lines and automated interactive services;
- calls abandoned by the customer within 30 seconds of the call being queued for response by a human operator. Where the time in which a telephone call is abandoned is not measured, then an estimate of the number of calls abandoned within 30 seconds will be determined by taking 20 per cent of all calls abandoned.
Note: Being placed in a queuing system (automated or otherwise) does not constitute a response. 'Calls answered within 30 seconds' and 'Calls received' should be calculated excluding calls abandoned within 30 seconds of being queued for a human operator; and calls to payment lines and automated interactive services.

Exclusions refer to the exclusions listed in Section 3.3(a) of the STPIS.

Table 1 Daily Performance Data (unplanned)

Date	CBD SAIDI All events	CBD SAIDI (after removing excluded events)	Urban SAIDI All events	Urban SAIDI (after removing excluded events)	Long Rural SAIDI All events	Long Rural SAIDI (after removing excluded events)	Short Rural SAIDI All events	Short Rural SAIDI (after removing excluded events)	Network SAIDI All events	Network SAIDI (after removing excluded events)	CBD SAIFI All events	CBD SAIFI (after removing excluded events)	Urban SAIFI All events	Urban SAIFI (after removing excluded events)	Long Rural SAIFI All events	Long Rural SAIFI (after removing excluded events)	Short Rural SAIFI All events	Short Rural SAIFI (after removing excluded events)	Network SAIFI All events	Network SAIFI (after removing excluded events)	CBD MAIFI All events	CBD MAIFI (after removing excluded events)	Urban MAIFI All events	Urban MAIFI (after removing excluded events)	Long Rural MAIFI All events	Long Rural MAIFI (after removing excluded events)	Short Rural MAIFI All events	Short Rural MAIFI (after removing excluded events)	Network MAIFI All events	Network MAIFI (after removing excluded events)	Customer service: Number of calls received	Customer service: Calls not answered in 30 seconds	MED	Comments / basis for exclusion - refer to category of exclusion under 3.3(a) of STPIS

STPIS Data Reporting
2013
MED Threshold

Table 1 MED Threshold

MED Threshold (Timed) year ending 31 December	5.05

Alpha - average of Ln(SAIDI)	-3.7005
Beta - Standard deviation of Ln(SAIDI)	2.1281
X Beta from the mean	2.5

Table 2 MED Calculation

Date	Network SAIDI All events	Network SAIDI (after removing excluded events)	Ln (SAIDI)

Note:
Exclusions refer to upstream events only and do not refer MED exclusions.
MED calculation starts from 5 years prior to the relevant regulatory reporting year (e.g. 2013 requires data from 1 January 2008 to 31 December 2012).

Jemena Electricity Networks (Vic) Limited
STPIS Data Reporting
2013
Exclusions

Table 1: Exclusions

Date of event (DD/MM/YYYY)	Feeder ID / name	Feeder classification	Number of interruptions (unplanned)	Duration of interruption (unplanned) (mins)	Total unplanned minutes off supply	Event category (use Exclusion categories listed in section 3.3 (a) of the AER's STPIS)	Effect on unplanned SAIDI	Effect on unplanned SAIFI	Effect on unplaned MAIFI	Please provide separate explanation to confirm the outage was not due to inadequate transmission connection planning	Cause of event (Use categories listed in table 1, Template 6C)

Note:
The AER's *Electricity distribution network service providers, Service target performance incentive scheme* , November 2009, p. 22, defines SAIDI and SAIFI.
The AER will apply the ESCV's definition of MAIFI for transitional reasons. The ESCV's Information specification (Service performance) for Victorian Electricity Distributors, 1 January 2009, p. 30, defines MAIFI as follows:
MAIFI - The total number of momentary interruptions divided by the average number of distribution customers over the regulatory reporting period. (where the distribution customers are network or per feeder based, as appropriate).

Jemena Electricity Networks (Vic) Limited
Demand
2013

Table 1 Customer Numbers by Voltage Level

Customer numbers by voltage level	
Subtransmission	
Hsh Voltage	
Low Voltage Residential	
Low Voltage Non-Residential	
Total - all customers	0

Table 2 New Customer Connections

Note: 'Total customer numbers' is the total average of end of prior year customers and end of current year customers

New connections	
Total new connections	
New customer connections as a % of total customers	#DIV/0!

Table 3 Customer Disconnections

Note: 'Total customer numbers' is the total average of end of prior year customers and end of current year customers

Disconnections	
Total disconnections	
Disconnections as a % of total customers	#DIV/0!

Table 4 Electricity Consumption

Electricity consumption by voltage level (MWh)	
Subtransmission	
Hsh Voltage	
Low Voltage Residential	
Low Voltage Non-Residential	
Controlled load	
Total consumption	

Table 5 Maximum Coincident Demand at the Network Level

Note: a) Maximum Coincident Demand at the Network Level is calculated as the sum of all maximum coincident demand for zone substations and all feeders from terminal stations.
b) Forecasts should be the demand forecasts for the relevant regulatory year that were made at the time of the regulatory proposal
c) t+1 forecasts should be the latest updates to the demand forecasts for the regulatory year t+1.
d) The PoE level only applies to the forecasts

Network coincident maximum demand	Forecast	Actual: raw	Actual: weather normalised	Variation %	t+1 forecast
90% PoE level					
Network coincident maximum demand (MW)				#DIV/0!	
Network coincident maximum demand (MVA)				#DIV/0!	
50% PoE level					
Network coincident maximum demand (MW)				#DIV/0!	
Network coincident maximum demand (MVA)				#DIV/0!	
10% PoE level					
Network coincident maximum demand (MW)				#DIV/0!	
Network coincident maximum demand (MVA)				#DIV/0!	

Ashley

Table 6 Summer or winter non-coincident maximum demand by zone substation

Note: a) Forecasts should be the demand forecasts for the relevant regulatory year that were made at the time of the regulatory proposal
b) t+1 forecasts should be the latest updates to the demand forecasts for the regulatory year t+1.
c) The PoE level only applies to the forecasts

Asset Installation
2013

Instructions
Insert rows for each of its asset types under each high level asset group. Additional groups may be added if a particular asset is not encompassed by the asset groups in the table.
Develop a set of asset types under the high level asset groups that represent its network asset base.
In determining whether a new asset type is required, whether asset types should be aggregated or whether asset types should be disaggregated, the DNSP should consider:
- the proportion of the overall replacement expenditure forecast for the assets
- the differentiation of unit replacement costs into clear and distinguishable distributions
- the differentiation of replacement lives into clear and distinguishable distributions
- multiple 'end of life' actions such as 'replacement' or 'life extension' (eg pole staking) - in the case of 'life extension', the DNSP should appropriately account for this in defining the replacement life and unit cost for the asset category.

Table 1 For each asset type, provide:
a) the mean replacement asset life (years)
b) the standard deviation of the mean replacement asset life
c) the replacement unit cost ($ nominal).
d) the total number of asset failures during the regulatory year
e) the total quantity (number) of each asset type that was commissioned in the relevant regulatory reporting year.

Table 1 Asset age profile for distribution system assets **Source of Guidance**

Statutory Account code or reference to account code	Asset group	Replacement life (years)		Replacement unit cost	Number of asset failures	Total quantity replaced	Total quantity installed	Year Commissioned (number of assets commissioned in each year)

Customer Service
2013

Table 1 Quality of supply

Over voltage events - due to high voltage injection	12
Customers receiving over-voltage - due to high voltage injection	485
Over voltage events - due to lightning	0
Customers receiving over-voltage - due to lightning	0
Over voltage events - due to voltage regulation or other cause	47
Customers receiving over-voltage - due to voltage regulation or other cause	5143
Voltage variations - steady state (zone sub)	72
Voltage variations - one minute (zone sub)	38
Voltage variations - 10 seconds (zone sub) Min<0.7	213
Voltage variations - 10 seconds (zone sub) Min<0.8	321
Voltage variations - 10 seconds (zone sub) Min<0.9	850
Voltage variations - steady state (feeder)	3392
Voltage variations - % zone subs monitored	100%
Voltage variations - % feeders monitored	91%

Table 2 Complaints - technical quality of supply

Complaints - technical quality of supply - number	167
Complaints by category (%)	
Low voltage supply	18%
Voltage dips	5%
Voltage swell	1%
Voltage spike (impulsive transient)	1%
TV or radio interference	1%
Noise from appliances	0%
Other	75%
Complaints by Likely Cause (%)	
Network equipment faulty	10%
Network interference by NSP equipment	0%
Network interference by another customer	0%
Network limitation	55%
Customer internal problem	3%
No problem identified	0%
Environmental	0%
Other	32%

Table 3 Customer service

Timely provision of services	
Connections made	7409
Connections not made on agreed date	5
Timely repair of faulty streetlights	
Streetlights - average monthly number "out"	255
Streetlights - not repaired by "fix by" date	4
Streetlights - average number of days to repair	3
Total streetlights	69058
Call Centre Performance (number, unless stated)	
Calls to call centre fault line	132673
Calls to fault line not answered within 30 seconds	29097
Calls to fault line - average waiting time before call answered	69
Calls abandoned - percentage	31%
Call centre - number of overload events	1
Customer complaints (number)	
Complaint - reliability of supply	18
Complaint - technical quality of supply	167
Complaint - administrative process or customer service	48
Complaint - connection or augmentation	80
Complaint - other	407
Complaint - AMI	890
Total complaints	1610

Note: for Table 3 **Calls to Call Centre Fault Line** means the total number of calls to the fault line to be reported, including any answered by an automated response service and terminated without being answered by an operator. Excludes missed calls where the fault line is overloaded.

JEN's explanatory notes

1 Voltage variations - steady state (zone sub) (cell H12)

An investigation will be carried out to identify the reasons of the increase in the number of steady state (>60 Sec) voltage variation events from zone substation PQ meter ES (Essendon Zone Substation) and ST (Somerton Zone Substation) which has largest contribution to these events.

2 Voltage variations - one minute (zone sub) (cell H13)

An investigation will be carried out to identify the reasons of the increase in the number of voltage variation events (one minute >10 sec & <60 sec) from zone substation PQ meter FW (Footscray West Zone Substation) which has largest contribution to these events.

3 Voltage variations - steady state (feeder) (cell H17)

The steady state voltage variations at end of feeders are still high for year 2013 as compared to year 2012. Jemena will carry out an investigation to identify the reasons for increase in the number of events from end of feeder meters BY14 (Braybrook), CS2 (Coburg South), EP3 (East Preston), FE6 (Footscray East) , FF90 (Fairfield), SHM14 (Sydenham) and YTS8 (Yarraville)

4 Voltage variations - % feeders monitored (cell H19)

Due to customer initiated project, one of the end of feeder PQ meter at AW (Airport West) zone substation area was taken out The meter will be put back to service at another site in January 2014. The other end-of-feeder power quality meter which is not It will not be re-installed until the feeder topology conversion work has been completed.

Jemena Electricity Networks (Vic) Limited
Annual Feeder Reliability
2013

Table 1 Annual Feeder Reliability Data

Feeder ID / name	Description of the service area for the feeder	Feeder classification	Number of distribution customers	Length of high voltage distribution lines (overhead)	Length of high voltage distribution lines (underground)	Maximum demand (MVA)	Energy not supplied (unplanned) (MWh)	Energy not supplied (planned) (MWh)	Total number of unplanned outages	Total unplanned minutes off-supply	Unplanned minutes off-supply (after removing excluded events and MED)	Unplanned interruptions (SAIFI)	Unplanned interruptions (SAIFI) (after removing excluded events and MED)	Total number of planned outages	Total planned minutes off-supply	Planned interruptions (SAIFI)	Total number of momentary feeder outages	Total number of momentary feeder section outages	Momentary interruptions due to feeder outages (MAIFI)	Momentary interruptions due to feeder outages (MAIFI) (after removing excluded events and MED)	Momentary interruptions due to feeder section outages (MAIFI)	Monetary interruptions due to feeder section outages (MAIFI) (after removing excluded events and MED)	Low Reliability Feeder (SAIDI)	Low Reliability Feeder (MAIFI)

JEMENA ELECTRICITY NETWORKS (VIC) LTD

REGULATORY ACCOUNTING PRINCIPLES AND POLICIES (2013)

Jemena Electricity Networks (Vic) Ltd (**JEN**) prepares the Regulatory Accounting Statements consistently with the requirements listed in the RIN as issued by the AER under Division 4 and Part 3 of the National Electricity (Victoria) Law. As its underlying principle, JEN prepares its statutory accounts compliant with the Australian Accounting Standards and the Statement of Significant Accounting Policies in the notes to the accounts, and only varies from these Standards and Policies where specifically required or permitted by the RIN.

The source of all financial information for the regulatory financial statements is the JEN general ledger and its support systems. JEN also uses data from other related party entities which is contained in their general ledger and support systems.

Revenues and costs contained in the General Ledger that can be directly attributed are assigned to the respective categories. However, if the revenue or cost cannot be directly attributed, an allocator is applied on a causation basis. At all times, JEN will apply transparent and verifiable allocators.

JEN will provide full and complete cooperation with the external auditors. All information provided is intended to be sufficient to enable the auditors to verify accuracy and compliance with the requirements of the RIN.

Table of Contents

1 Introduction

Jemena Electricity Networks (Vic) Ltd (**JEN**) is the owner of the electricity network covering the northwest area of Melbourne metropolitan. JEN provides services including (but not limited to) those listed in Table 1-1 to over 300,000 customers. Table 1-1 groups the services by JEN's proposed classification of those services under the National Electricity Rules (**NER**). This classification may change, depending on the outcome of the 2011-15 distribution price review process being undertaken by the Australian Energy Regulator (**AER**).

Table 1-1: JEN Services

Services	Descriptions
Standard Control Services	• Construction of the distribution network • Economic connection and augmentation works for new connections • Maintenance and operation of the distribution network and connection assets • Planning and designing the distribution network • Emergency response • Administrative support (e.g. network billing)
Alternative Control Services	• Uneconomic connection and augmentation works for routine new connections • Metering data provider services for unmetered supplies with Type 7 metering installations • Supply enhancement at customer request • Emergency recoverable works (i.e. emergency works where customer is at fault) • Preparation of design and specification for 3rd parties in relation to customer initiated works that are contestable • Auditing of design and contestable construction undertaken by 3rd parties • Energisation and de-energisation of supply points • Temporary supply services • Service truck visits & wasted truck attendance • Location of underground cables • Elective underground service where an existing overhead service exists • Covering of low voltage mains for safety reasons • Testing of metering installations • Supply abolishment • Fault response — not DNSP fault • Damage to overhead service cables by third parties • High load escorts — lifting overhead lines • Operation, repair, replacement and maintenance of DNSP public lighting assets
Negotiated Distribution Services	• Uneconomic connection and augmentation works for non-routine new connections

Services	Descriptions
	• Public lighting services - New public lighting • Public lighting services – Alteration and relocation of public lighting assets

This document addresses the allocation of costs to the above mentioned services.

If the service classifications in the AER's final distribution determination differ from those outlined in this CAM, JEN will amend sections this CAM in accordance with clause 4.2(a) of the cost allocation guidelines.

2 Organisational and operational structure

JEN is a 100 per cent owned subsidiary of Jemena Ltd (**JEM**). JEN is a wholly owned subsidiary of SPI (Australia) Assets Pty Ltd (**SPIAA**), which is in turn 100 per cent owned by Singapore Power International (**SPI**). Refer to Appendix 1 for the corporate structure of SPIAA's holdings, which include JEN and JEM.

While JEN owns the electricity network assets, Jemena Asset Management Pty Ltd (**JAM**) provides all maintenance and capital expenditure services through in-house and external resources whereas enterprise support services, such as Legal, Finance and Human Resources, are provided to JEN by JEM.

As such, the Senior Management group directing the JEN business entity resides within JEM, while the day to day operational management of network services is provided by JAM. JEM's operational structure, as it relates to JEN, is set out in Appendix 2. Appendix 3 also provides a visual representation of the flow of distribution services and contributing services from JEN and its subcontractors through to customers.

Apart from JEN, JAM also provides services to:

- other assets owned or part-owned by JEM or SPIAA, such as Jemena Gas Networks, ActewAGL and, in conjunction with Jemena Asset Management (6) Pty Ltd (**JAM 6**), United Energy Distribution Pty Ltd (**UED**) and Multinet Gas (DB No.1) Pty Ltd and Multinet Gas (DB No.2) Pty Ltd trading as Multinet Gas Distribution Partnership (**MGH**); and

- external clients, such as Aurora Energy, SP AusNet (**SPN**) and Powercor.

3 Nature, scope and purpose

Sections 2.2 and 3.2 of the Victorian Cost Allocation Guidelines (**the Guidelines**) outline the requirements applicable to a Victorian distribution network service provider (**DNSP**) in preparing and submitting its proposed cost allocation method (**CAM**) to the AER for approval, including the development of detailed principles and policies for attributing costs to, or allocating costs between the categories of distribution services it provides.

In addition, the cost allocation principles, policies and approach are to be consistent with the ring-fencing guidelines set out in clause 6.17 of the NER. The CAM therefore complies with previous jurisdictional ring fencing requirements and will continue to do so until such time as these are replaced by the AER's new distribution ring fencing guidelines (in accordance with National Electricity Rules clause 11.15.5) after which time Jemena Group will ensure that the CAM complies with the requirements of the final Ring-Fencing Guideline once it is published.

Clause 6.15.1 of the NER requires JEN to comply with the CAM approved by the AER for relevant regulatory reporting, as noted in section 5.1(b) of the Guidelines.

Accordingly, JEN has prepared the CAM, as detailed in this document, for the purposes of JEN regulatory cost allocations over the 2011-15 regulatory period (**the regulatory period**). The CAM has been developed with regard to previous cost allocations in accordance with the Victorian Essential Services Commission (**ESC**) distribution pricing determination and as a consequence complies with those requirements and with the reporting requirements of Guideline 3. It is intended to provide an approach for allocating costs for regulatory reporting purposes.

JEN is aware that the Guideline requires that the CAM allow for the effective comparison of historical and forecast cost allocations between periods. However, JEN's electricity network was owned by AGL until October 2006 and the organisational structure of the company has changed considerably as a result of the change of ownership since then by Alinta Ltd and now SPIAA. Furthermore, JEN does not have access to certain past data relating to the periods of prior ownership.

For these reasons, JEN is not able to apply an identical cost allocation methodology to that used in the years up to 2007, to the 2008 calendar year or future years and is not able to reproduce the costs for the years prior to 2008 in an identical manner to the proposed CAM.

However, despite the detailed cost allocation methodologies being different, comparisons with prior, current and future periods are not materially impacted by these changes. The underlying approach that has been adopted in assigning direct costs based mainly on activity based costing, cost centre and general ledger account balances and the allocation of shared costs via the use of a causal based allocator, has remained substantially similar.

Accordingly, the CAM has been designed to achieve consistency with the previous allocation methodology to the maximum extent practicable, and to allow for comparison of historical and forecast cost allocation between the 2006-10 and the 2011-15 regulatory periods by:

- utilising present accounting processes and systems that support JEN's compliance with management and financial reporting requirements, and
- taking into account incremental enhancements to present systems, such as the recent implementation of time-writing.

Furthermore, JEN has developed the proposed CAM as the means to allocate costs going forward in a consistent manner that meets all other regulatory requirements to the maximum practicable extent.

Applying the CAM will ensure that:

- costs are reported consistently in each year of the regulatory period;
- costs are attributed directly to or allocated between categories of distribution services based on the substance (over the legal form) of the underlying transaction or event; and
- direct costs are only allocated once to one category of distribution services and shared costs are only allocated once between categories of distribution services.

4 Accountabilities and responsibilities

If approved by the AER, the CAM will commence on 1 January 2011. The CAM, once in place, is also expected to be used for all regulatory reporting purposes. It will primarily be used for annual Regulatory Accounts reporting and for determining the appropriate costs to support and substantiate future price submissions to the AER.

Jemena Group is committed to the ongoing application of the CAM which will be approved formally by the JEM Leadership Team prior to implementation. Furthermore, a statement outlining JEM's commitment to the ongoing application of the CAM will be detailed in a Regulatory Accounting Policy Statement, and maintained on the JEM website.

The CAM will be the primary responsibility of the General Manager, Finance, Infrastructure Investments, who will:

- conduct periodic reviews of the CAM;
- liaise with the CFO, Business Unit Managers, Finance Managers and their staff where issues are raised; and
- act as the reference point for all queries regarding the CAM in relation to Regulatory matters.

Any potential change to the CAM will be subjected to a materiality test. For purposes of determining materiality, JEN has adopted the AER's definition used in its Cost Allocation Guidelines – that is, "an item is material if its omission, misstatement or nondisclosure has the potential to prejudice the understanding of the financial position of the DNSP (Distribution Network Service Provider), gained by an assessment of financial information relating to the DNSP". The process by which JEN will monitor compliance with the CAM is outlined in section 8.

5 Distribution services

JEN provides distribution services, including standard control services, prescribed metering services, alternative control services, negotiated services and other unregulated services as set out in Table 5-1. JEN allocates its costs between all these categories of services.

Standard Control Services (formerly prescribed services) include the provision of network capability and maintenance of the distribution network. They cover services such as asset maintenance, vegetation control and restoration of supply. These services are provided to all

residential, small business and large business end-users of the network. The costs for providing these services are recovered via electricity tariffs that have been approved by the AER.

Alternative Control Services (formerly part of excluded services) include disconnections and reconnections for existing sites, metering services for unmetered supplies, operation, maintenance and repairs of public lighting assets, service truck visits, covering of low voltage mains, meter equipment testing and meter conversions, and elective underground services. The costs of providing these services are recovered by either a set fee approved by the AER or via a quoted price.

Negotiated Distribution Services (formerly part of excluded services) include uneconomic connection and augmentation works for new connections, new public lighting and relocation of public lighting assets. The costs of providing these services are recovered by cost negotiation and agreement with the end-user.

Prescribed Metering Services include the provision of meter data services. The approval of charges for providing these services is covered by a process outside of Chapter 6 of the NER.

Unregulated services include metering services that are not regulated by the NER, as well as network-related services provided by JEN not covered by the other classifications.

Table 5-1: Distribution services performed by JEN

Distribution service provided	Persons to whom services are provided
Standard control services	End-use electricity customers i.e. residential, small business and large business entities.
Prescribed metering services	
Alternative control services	
Negotiated services	Services performed directly for customers.
Other unregulated services	

Notes:

- Standard control, prescribed metering and alternative control services are undertaken for end-use electricity customers within the geographical boundaries of the network. These users are themselves customers of various electricity retailers. JEN therefore invoices relevant retailers for the various distribution services provided to these end-users.
- JEN deals directly with Councils for public lighting services. Negotiated services and other distribution services are performed for, and charged directly to, the particular customer.

6 Cost allocation principles and policies

6.1 Overview of Costing Processes in Jemena Group

As discussed in section 2, JEN, JAM and JEM are part of the Jemena Group, which also includes other assets. Relevant Jemena Group costing processes and how they relate to JEN's CAM are explained as follows.

JEM utilises the SAP Enterprise Resource Planning (**ERP**) corporate business system to capture, control and report its costs by general ledger cost account within cost centres. Most direct costs are

assigned to unique client projects codes by assigning costs to Work Breakdown Structures (**WBS**) (individual job numbers) which in turn are grouped to individual activity codes that identify WBS projects of a similar nature (such as pole inspections for maintenance or pole replacements for capital works). These codes capture costs associated with individual projects that relate to specific client contracts and activity types required for management and regulatory reporting. These costs are captured within the SAP ERP project accounting ledger.

Shared (or indirect) costs are costed to general ledger accounts within cost centres, similar to direct costs. These shared costs do not relate to one particular activity but rather support a range of business activities.

6.2 Directly attributable costs

Labour costs for work performed and other costs incurred (such as materials consumed) on capital construction jobs, maintenance jobs and certain types of operational work, are allocated to a unique project code linked to an activity code in SAP. The labour costs allocated to these unique project codes can be traced back to the organisational group that incurred these costs and the cost function that identifies the type of cost, such as labour and materials. In this way, SAP ERP project accounting effectively tracks each individual client project via unique client project codes. These project codes are used to capture direct costs associated with individual projects that relate to specific client contracts, client activity types and client billing types. These costs are treated as 'direct' in nature. For any instance where a direct cost has not been assigned to a specific activity code that enables the nature of the service being provided to be clearly identified, the cost will be allocated as if it is a shared cost (see section 6.3 below).

Specifically, the SAP system enables JAM to capture and report project costs (i.e. direct costs) by WBS element. Each WBS element corresponds to an activity type, which relates to the nature of the works carried out of a capital, operating and maintenance nature. The activity type also identifies the type of service being provided and is therefore used to directly assign these costs to standard control, alternative control and negotiated distribution services.

Following the allocation of direct costs to activity codes, there remain unallocated regional direct costs, which represent a residual amount that has not been allocated to specific projects. Where costs can be identified as relating directly to specific regulatory cost categories (such as costs residing in a billing cost centre that relate to the network use of system billing), they are allocated to the particular type of service provided – standard control, alternative control, negotiated distribution services or unregulated services. Where these costs cannot be specifically assigned, they form part of the shared cost allocation process, as described in section 6.3.

Cost items, such as labour and materials, are allocated in the manner described below. Table 6.2 summarises what is included in each cost item and the basis for allocation of these costs. Specifically, the costs listed in this table are directly allocated to standard control services, alternative control services, negotiated distribution services, prescribed metering services and unclassified services.

SAP electronic timesheet processing commenced in December 2009 and is expected to be fully operational by March 2010. Under this approach *all* Jemena Group staff, will be required to capture their actual hours against a variety of cost objects (cost centre, profit centre, WBS or Program Maintenance order). These cost objects will range from existing unique chargeable client projects, indirect client contracts to other internal projects. Accordingly, labour based activity costs will be used wherever possible for reporting all directly attributable costs in the next regulatory period.

All materials issued to capital and maintenance jobs have an on-cost added to recovery the costs of operating the Logistics (stores) cost centre and the procurement function for JEN. This process was put in place to ensure that these costs were correctly assigned to the jobs that were users of this service. This on-cost amount is included in the WBS and activities (refer above) for all capital and maintenance jobs as a component of the total cost of that work and therefore is an automated process within SAP. After assigning the cost to each job, a credit equivalent to the amount of the on-cost on the material item issued from the store is offset against the operating costs of the Logistics cost centre to ensure that the costs of operating the Logistics cost centre and JEN procurement function is only allocated once. As the on-cost rate is generally fixed for the year, there may be an over or under recovery of the costs of running the Logistics cost centre and JEN procurement function, depending on the total amount of store operating and procurement costs to be allocated and the amount of materials consumed each year. Any over (credit) or under (debit) cost recovery is retained within the Logistics cost centre and will form part of the shared costs to be distributed as outlined in section 6.3 below. This process is illustrated in the following example in relation to one item of materials worth $1000 (before applying the on-cost):

Value of Materials Issued from Store	On cost rate	Total cost of materials costed to the job	Credit to Inventory	Credit to Logistics cost centre	Logistics Cost centre and Procurement function for JEN	Comment
$1000	8%	$1080	$1000	$80	$400,000 ($80) $399,920	Total annual cost of operating Logistics and JEN related procurement functions. Less on-cost recovery Total remaining amount of the annual operating cost of the Logistics Cost Centre and JEN procurement functions to be recovered from future material issues from the store.

Reports utilising data from SAP which show the costs of the Logistics store and the JEN procurement function as well as the amount of the on-cost credited to the Logistics cost centre, will enable the cost allocation process and its outputs above to be verified.

Costs reported under certain general ledger accounts are also assigned directly to specific cost categories (for example Guaranteed Service Levels costs have their own General Ledger account). Costs in these accounts are able to be assigned to standard control, alternative control and negotiated distribution services using the definitions contained in the ESC's Guideline 3.

The activity codes are also used to appropriately assign costs to standard control, alternative control, negotiated distribution and other unregulated services, as each of these activity codes are uniquely and individually identified to the different service categories. For example, the activity

codes allow costs to be identified that relate to pole inspections, vegetation control, overhead line maintenance, fault and emergency (all of which relate to standard control services), public lighting (alternative control service), connection of embedded generation (negotiated service) and meter data services (unregulated services).

Directly attributable costs are shown in Table 6-1: Directly Attributable Costs below:

Table 6-1: Directly Attributable Costs

Cost Location	Cost Item	Cost Relationship	Allocator	Description	Basis of Allocation	Services Allocated To
JAM	Direct Labour Costs	Direct	N/A	Direct labour costs include: 'Normal and overtime salaries and wages, associated payroll on-costs and employee & industry allowances and the recovery of motor vehicle and plant costs	Field crews complete timesheets that record their actual hours worked on individual projects. 'These timesheets are usually entered into SAP by local Business Service Officers. A minority of field based personnel, and all office based personnel, enter their timesheet data directly into SAP. SAP functionality then enables an automatically generated direct labour cost transfer posting from the employee's cost centre to the relevant project.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM	Subcontractor Costs	Direct	N/A	External labour contractors may be sourced to supplement the existing workforce for specific projects, additional workloads or to cover employee absences.	Subcontractor costs are receipted against the outstanding purchase order and recognised against the project.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM	Material Costs	Direct	N/A	Material costs include stock items distributed through JEM's centralised warehouse and specific purchases of irregular or low turnover items. An on-cost is added to stock material to cover the cost of purchasing, warehousing and delivery of materials held in the central store.	Material costs are assigned via the SAP materials management system. This system enables materials from stores to be issued to individual capital and maintenance projects. Materials can also be purchased from an external party, via a SAP purchase order process. When the goods are receipted against the outstanding purchase order, the material costs are recognised against the relevant project.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEN	Other Direct Costs	Direct	N/A	Other costs include such items as High Voltage injection payments, distribution licence fees and other governmental charges such as council rates.	Other costs are posted to the relevant project via the accounts payable function or directly to a cost category where appropriate by reference to the cost centre or general ledger account.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated

6.3 Shared costs

In addition to direct costs, JEN and its service providers also incur shared costs. These costs do not directly relate to the delivery of specific categories of JEN's services, but do relate indirectly to all services provided by JEN. These costs therefore need to be assigned to service categories via the use of an allocator.

6.3.1 Shared cost summary

A summary of JEN's shared costs is provided in Table 6-2 below

Table 6-2: JEN Assignment of allocators to cost items

Cost Location	Cost Item	Cost Relationship	Description	Services Allocated To
JEM ESF	Chief Executive Officer	Shared - Causal	Management of regulated asset base, equity investments in regulated assets and asset management functions.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Chief Financial Officer	Shared - Causal	Management of financial reporting & financial management, and funds management	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Corporate Accounting	Shared - Causal	External corporate reporting of the Jemena group of companies	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Energy Investments	Shared - Causal	Strategic and operational management of regulated assets.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Financial Strategy	Shared - Causal	Management of corporate business systems	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Financial Accounting	Shared - Causal	Management of Financial Accounting	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Investment Analysis	Shared - Causal	Strategic financial management of assets and potential corporate acquisitions	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Legal	Shared - Causal	Regulatory, employer and contract management; company secretarial	Standard Control Prescribed Metering Alternate Control Negotiated

Cost Location	Cost Item	Cost Relationship	Description	Services Allocated To
				Other Unregulated
JEM ESF	Business Services	Shared - Causal	Customer service and marketing functions	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Corporate Affairs	Shared - Causal	Management of corporate communications to employees and clients	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Health Safety & Environment (HSE)	Shared - Causal	Employee HSE training and monitoring	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Human Resources	Shared - Causal	Management of recruitment and payroll services	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Financial Improvement	Shared - Causal	Management of Jemena corporate business structure	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Information Services	Shared - Causal	Provision & management of IT infrastructure and services both general and client specific.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Regulatory	Shared - Causal	Strategic and operational regulatory compliance	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Risk & Insurance	Shared - Causal	Internal audit and risk assessment.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JEM ESF	Taxation	Shared - Causal	Management of indirect and direct tax compliance and planning.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated

Cost Location	Cost Item	Cost Relationship	Description	Services Allocated To
JEM ESF	Treasury	Shared - Causal	Management of cash flow and funding arrangements	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM Corporate	Asset Services	Shared - Causal	Asset Strategy and Engineering Services	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM Corporate	Chief Operating Officer	Shared - Causal	Management of Asset Strategy and Infrastructure Services functions.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM Corporate	Regional	Shared - Causal		Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM Corporate	Finance	Shared - Causal	Management of financial reporting & financial management	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM Corporate	Business Strategy	Shared - Causal	Management of Business & Commercial Strategy and Planning function.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM Corporate	Business Services & IT	Shared - Causal	Management and service delivery of customer relations management, call centre management and meter reading services functions.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM Corporate	Regulatory	Shared - Causal	Strategic and operational regulatory compliance	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated
JAM Corporate	Program Management	Shared - Causal	Management of program methodology and project office functions.	Standard Control Prescribed Metering Alternate Control Negotiated Other Unregulated

6.3.2 Shared costs allocation

The shared costs applicable to JEN are allo cated to standard control, alternative control, negotiated distribution services and unregulated services based on the proportion of direct costs for each service category to total direct costs.

This allocator is based on the view that direct costs are the most appropriate method to allocate shared costs across service categories and provide an easily verifiable method that can be consistently applied each year. They also enable the amount of shared costs allocated to each service category to be replicated by reference to the percentage of direct costs relating to each service category (as reported in the regulatory accounts) and then applied to the total amount of shared costs.

To illustrate this, assume that the total operating and maintenance costs of JEN are $80 m consisting of $50m direct costs and $30m shared (indirect) costs. Of the $50m direct costs, assume that $40m relates to SCS (or 80% of total direct costs), $7m to ACS (14% of total direct costs), $1m to NDS (2% of total direct costs) and $2m to unregulated services (4% of total direct costs). The actual direct costs would be determined via the process described in section 6.2 above. The allocation of the $30m of shared costs to the various service categories will be made by allocating 80% of $30m which is $24m to SCS, 14% of $30m which is $4.2m to ACS and so on for the other service categories. Table 6-3 below shows the relevant calculations for the example.

Table 6-3: Shared cost allocation calculation example

	Total	Service Category			
		SCS	ACS	NDS	Unregulated
$ Direct costs	50M	40M	7M	1M	2M
% of Direct Costs:	100%	80%	14%	2%	4%
$ Shared Costs	30M	24M	4.2M	0.6M	1.2M
$ Total costs	80M	64M	11.2M	1.6M	3.2M

Note that during the roll-out phase of the AMI program, all AMI-related costs are outsourced and are being captured and reported separately from all other costs incurred by JEN. Under the AER's classification, AMI metering services are considered to be unregulated services for the 2011-2015 regulatory period. During the commencement of the operational phase of AMI metering services, JAM will establish accounting processes to capture direct costs within a separate cost category for JEN.

7 Record maintenance

All relevant documentation, namely the final approved Regulatory Accounts, the supporting audit opinions and other approvals (such as the Audit Tripartite Deed), together with all the records supporting the allocation of costs (direct or shared) are maintained on Jemena Group's accounting systems and Information System database.

These records are supported by the company's comprehensive record protection procedures and practices, as well as relevant data recovery and back up processes.

Information contained in this database is provided to auditors upon request to enable audits of the Regulatory Accounts and other documents to take place as necessary.

8 Compliance monitoring

8.1 Day to Day Use of the CAM

The CAM utilises the activity code data derived from the timewriting process and the charging of costs to jobs that are linked to these activity codes. Some direct costs assigned to the service categories in the CAM are based on costs reported in the SAP general ledger by cost centre and general ledger account. The quality of this data, which is also used extensively in management reporting and is an integral part of the SAP financial data used for the preparation of statutory accounts, is constantly monitored by management and accounting staff as part of the regular business reporting and financial analysis processes in Jemena Group. Both external and internal audits are conducted on the processes used to produce the costs and any material discrepancies or abnormalities are reported to management for rectification. Follow up procedures apply to ensure appropriate action is undertaken within agreed timeframes.

Note that the operational management by JAM of day to day JEN network services, reflected in the costs reported in these activity codes, is embedded in an asset management agreement between JEN and JAM.

8.2 Use of the CAM in Regulatory Reporting

Regulatory Accounts are reviewed and endorsed by JEN management, and include an explicit statement (having made all the relevant inquiries) that the financial statements have been prepared in accordance with the approved CAM. In addition, the accounts will also be reviewed by independent auditors.

Through the management review and the audit processes, JEN will satisfy itself whether the costs have been correctly assigned to the service categories. In addition, both JEM and JAM are also required to provide JEN with all reasonable assistance and cooperation to enable JEN to provide information required to be given to the AER, including the allocation or designation of any fees, charges, costs or other amounts in a manner which reflects any methodology approved by the AER.

A GRI Rating: Sustainability Report 2011

Auditor's Statement

Parsons Brinckerhoff audited the RIN information prepared by Jemena Electricity Networks Pty Ltd (JEN) for the Australian Energy Regulator for the period 1 January 2013 to 31 December 2013 in respect of the Service Target Performance Incentive Scheme (STPIS).

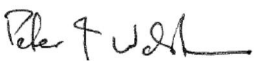
Parsons Brinckerhoff meets the requirements of "Class of person to conduct the audit" as outlined in Appendix E, paragraph 2.1 of the Regulatory Information Notice (RIN).

This audit report has been prepared in accordance with the audit requirements outlined in Appendix E of the RIN. The auditor's responsibility is to make an assessment of the processes, procedures and systems employed by JEN to produce the information required. Accordingly, Parsons Brinckerhoff has assigned a compliance grade to each parameter relating to the STPIS.

The audit grades are summarised in Table 1.1 below.

The audit involved performing procedures to obtain audit evidence about the information and disclosures in the RIN. The procedures used depended on the auditor's judgment, including the assessment of the risks of material misstatement at the disclosure level, whether due to fraud or error. In making the risk assessments, the auditor considered internal controls, system controls relating to the preparation and fair presentation of the estimates and disclosures made in the RIN in order to design audit procedures that are appropriate in the circumstances.

Yours sincerely



Peter Walshe
Principal Consultant
Parsons Brinckerhoff Australia Pty Limited

1. Introduction

This section of the report provides background on the need for the work, describes the audit and review approach undertaken by Parsons Brinckerhoff and sets out the report structure.

1.1 Background

The Australian Energy Regulator (AER) has issued a Regulatory Information Notice (RIN) under Division 4 of Part 3 of the National Electricity (Victoria) Law to Jemena Electricity Networks Pty Ltd (JEN) on 5 June 2011. This notice requires JEN to provide and to prepare and maintain information in a manner and form specified in the Notice. The requirements which must be complied with and the information which must be provided by JEN to the AER (in respect of Victorian electricity distribution services) are for the purpose of:

- monitoring the compliance of JEN with the 2011-15 distribution determination
- publishing reports
- making future distribution determinations.

1.2 Scope of work

JEN engaged Parsons Brinckerhoff to undertake a compliance audit of the non-financial information provided by JEN to the AER for the period 1 January 2013 to 31 December 2013.

The information audited was:

- regulatory templates 1a, 1b, 1c, 1d and 1e in respect of the Service Target Performance Incentive Scheme (STPIS)

This report does not include the audit of:

- regulatory template 2 in respect of demand forecasts
- regulatory template 3 in respect of asset installation.

1.3 Persons conducting the audit

Appendix E of the RIN sets out requirements for the class of person to conduct the audit. Parsons Brinckerhoff's attests that it meets these requirements, specifically:

- Parsons Brinckerhoff is independent from JEN and all of its related bodies corporate.
- A trained lead auditor managed the audit process and is responsible for the audit.

- Members of the audit team have audit experience gained through conducting performance audits of electricity businesses, including data sampling in the electricity industry.
- Members of the audit team have the relevant technical knowledge of the areas audited and the associated engineering, IT systems, asset management and customer service aspects. They also understand the procedures and methodologies underlying the data and the AER's relevant definitions for all information.

1.4 Overview of audit methodology

The auditor's audit approach was conducted in compliance with the audit requirements outlined in Appendix E of the RIN. The audit approach reflects a reasonable or positive level of assurance.

Audited items were assessed for their reliability as determined from the review of the processes, procedures and systems used to generate the data. The audit of the STPIS data also extended to whether the processes, systems and procedures used to produce the data were reliable, correctly applied, consistent with the parameter definitions and exclusions of the STPIS, and whether systems were able to competently identify and correct errors.

This audit focused on two specific areas: firstly, identifying and assessing any changes to the systems and procedures that have occurred since those audited for the 2012 calendar year; and secondly, assessing the systems and procedures that have been put in place to ensure quality control and data verification have been undertaken.

The audit methodology involved the following steps:

- Develop audit procedures
- Review existing material
- On-site review
- Draft report
- Final report.

This is the third time Parsons Brinckerhoff has undertaken the audit of JEN's RIN. ASAE 3000 allows the auditor to rely on the results of previous audit findings and focus on changes that occurred between audit periods. Clauses 3.2(b)(v) and 3.2(b)(vi) in Appendix E of the RIN require the auditor to assess for changes since the last audit was conducted and if the data correlates to the previous audit. To comply with these requirements, Parsons Brinckerhoff was able to rely on the previous audit and focus on assessing any changes to the systems and procedures.

1.5 Audit grades

The grading system used to assess the information provided was designed to align to the assessment criteria specified in Appendix E of the RIN and requirements of ASAE 3000. The grading system assesses each input to the RIN against six criteria using a three part scale – green, orange and red. The criteria and scale are described in Table 1.1 and Table 1.2. The assessments of each of the criteria are then considered together to apply an overall compliance grade to the data input. The four possible compliance grades are described in Table 1.3. The final result for each item assessed will be a 'sum' of the 6 criteria based on the following guidelines:

- If only 'green' is assigned, then the item will be compliant.

- If there is one or more 'orange' assigned, a judgment will be made on the overall materiality of any errors introduced by the identified gaps to determine if the item is mostly-compliant or non-compliant. Reasons will be provided for the judgement.
- If there is one or more 'red' assigned, then the result will be non-compliant. Reasons will be provided for the judgement.

The auditor notes that an assessment of the accuracy of the information presented in the RIN was not required to be assessed under the Appendix E of the RIN issued by the AER for JEN.

Table 1.1 Reliability assessment levels and descriptions

Criteria	Description
1	Reliability: Reliable systems have been established to provide, prepare and maintain the information.
2	Documentation: The processes and procedures are complete, well documented, approved, subject to regular review, and are accessible by staff.
3	Understanding: Staff have a good understanding of the processes, systems and procedures and applied them correctly during the audit period.
4	Definitions: The correct parameter and calculation definitions, as defined by the AER, were applied.
5	Error correction: The systems and procedures used are able to competently identify and correct errors or unusual trends that suggest errors in information entry or manipulation.
6	Repeatability: The systems provide information that corresponds to previously provided information.

Source: Parsons Brinckerhoff

Table 1.2 Reliability assessment levels and descriptions

Grade	Description
	Criteria is met
	Criteria is not met but the gaps have an immaterial effect
	Criteria is not met and the gaps result in material error(s)

Source: Parsons Brinckerhoff

Table 1.3 Compliance assessment levels and descriptions

Grade	Description
Compliant	All definitions are consistent with the requirements. Systems, processes and procedures have been implemented for all aspect of data gathering and reporting.
Mostly-Compliant	Most definitions are consistent with the requirements. Those definitions that are not consistent have an immaterial impact on the reported information. Systems, processes and procedures have been implemented for most aspect of data gathering and reporting. Those aspects that are not cover by systems, processes or procedures have an immaterial impact on the reported information.
Non-Compliant	Not all definitions are consistent with the requirements. Systems, processes and procedures have not been implemented for data gathering and reporting.
N/A	There are no definitions that need to be complied with for this particular process.

Source: Parsons Brinckerhoff

1.6 Report structure

This audit report is structured as follows:

- Section 2 STPIS – reliability parameters
- Section 3 STPIS – customer service parameters

2. STPIS – reliability parameters

This section outlines the auditor's assessment of the reliability of JEN's system, processes and procedures used to report the STPIS RIN figures in relation to reliability of supply (Templates 1a, 1c, and 1d of the RIN) and exclusions (Template 1e of the RIN).

2.1 Summary of audit requirement

Section 3.2 of Appendix E of the RIN sets out the audit requirements. The focus of the audit is on the reliability of the processes and procedures used, and the systems applied, to provide, prepare and maintain the information required by RIN templates 1a, 1c, 1d and 1e.

The auditor is to assess whether the processes, procedures and systems were correctly used and applied by the relevant staff, and that the definitions and data exclusions were in accordance with the STPIS.

Further, the auditor must assess whether the systems used are able to competently identify and correct errors, and if the RIN templates being audited show any corrections.

In relation to exclusions, the audit requirement involves an assessment of the reasons for any exclusions and the measurement of those exclusions.

2.2 Overview of JEN's reliability of supply reporting systems

2.2.1 Outage data management systems

Outages on the electricity network are recorded using a suite of data bases, with inputs from the network model and operators mostly in real time. A flow diagram of JEN's data collection, recording and reporting process is outlined in Figure 2-1.

The key systems are described below.

The Outage Management System (**OMS**) was implemented in June 2010. It records switching data directly from SCADA and receives data from non-telemetered devices from operators changing status of switches. Customer numbers are built into OMS via the Network Model. Complex switching records can be cancelled and recreated (if corrections are required) and logs of all corrections are retained.

The Operation Instruction Writer (**OIW**) is used by operators to develop switching procedures and record actual open/close times for non-telemetered devices when dealing with field crews. Actual open and close times are manually recorded on an OIW form for each isolation or restoration of customers.

COGNOS is a front-end reporting tool/application used to extract data from OMS, using prewritten filters/scripts to produce defined report formats, and output the data into various formats including PDF, Excel and text files. COGNOS is not a database and therefore does not store data.

CMOS is the database that stores information extracted from OMS by COGNOS. The data is stored in an Access data base and can be modified by JEN staff.

The Supervisory Control and Data Acquisition (**SCADA**) system inputs operations of all telemetered equipment directly into OMS. Each open/close signal input by SCADA is time stamped.

The **Network Model** shows the configuration of the network, which is updated daily, and allows OMS to calculate the number of customers affected by each outage. Customer information is input into the network model by three systems: GIS, CIS+ and AMI.

The **Daily Situation Report** is a report produced daily that includes the output of the OIW which identifies any manual switching events and the actual times that the switching occurred.

The **Monthly Change Log** captures any changes to data in CMOS. It is reviewed for anomalies and for verification against the Daily Situation Reports.

GIS, SAP and **CIS+** are the sources of customer number data, including customer geographical locations and network connection points that is input into the Network Model and used by OMS to calculate the number of customers affected by each outage. SAP is the database of customers having smart meters installed as part of the Advanced Metering Infrastructure program.

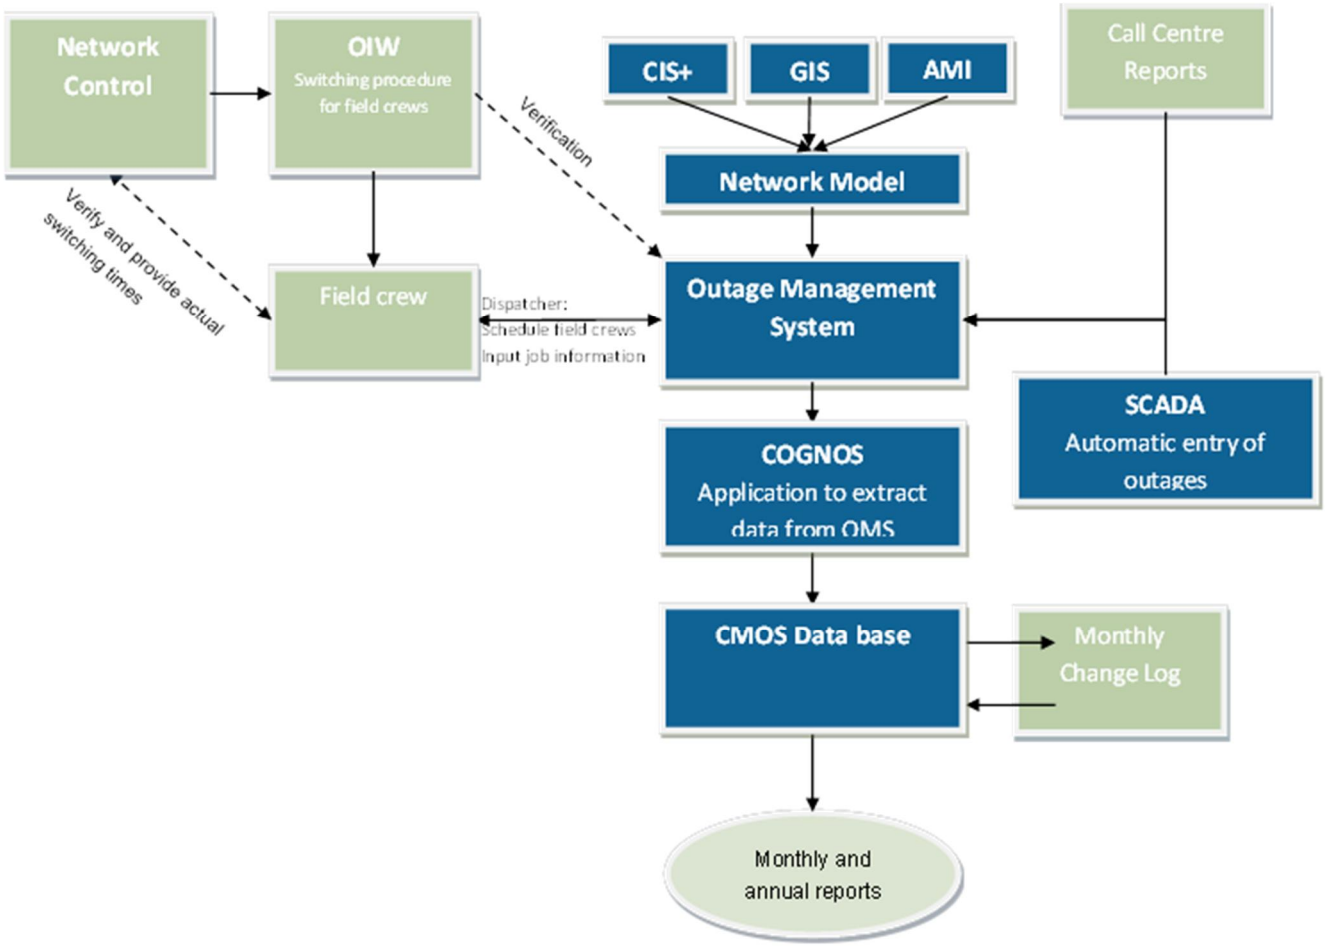

Figure 2-1 Flow diagram of JEN's reliability data reporting systems

2.2.2 Definition of feeder categories

The STPIS classifies feeders as CBD, Urban, Rural Short or Rural Long. JEN's network contains only Urban and Rural Short type feeders. These are classified in accordance with the STPIS definitions, viz:

- CBD – supplies predominantly high rise commercial buildings, supplied by a predominantly underground distribution network containing significant interconnection and redundancy compare to urban areas
- Urban – not a CBD feeder, with actual maximum demand over the reporting period per total feeder route length greater than 0.3 MVA/km
- Rural short – not a CBD or Urban feeder with a total feeder route length less than 200km
- Rural long – not a CBD or Urban feeder with a total feeder route length greater than 200km

JEN assesses the feeders annually at the start of each year for the previous year, i.e. January 2014 data is used to classify the feeders for the 2013 calendar year. The feeder length is taken from GIS and the maximum feeder demand is obtained from the Network Planning and Development Group.

The following processes are implemented for specific feeders:

- Feeders that have capacity reserved for backup supply or other reasons are assigned a classification as though the reserve capacity was being utilised. That is, they are classified the same as the primary feeder.

- New feeders are assigned a classification based on the forecast load density.
- There are four feeders shared with Powercor:
  - SA2 is rural short based on max demand/length in the JEN network area
  - SA12 is urban based on max demand/length in the JEN network area
  - SA6 and SA10 are both urban based on the classification of feeders in the surrounding area, as the demand or length in the JEN area is too small to correctly classify these feeders.

A copy of the report is retained so the system configuration can be compared in subsequent years.

Detailed attention is given to feeders which are close to the boundary conditions.

2.2.3 Customer numbers

Customer numbers are held in the Network Model which is updated daily from three information sources: GIS, CIS+ and SAP. There are only 83 high voltage customers, and they are managed and reported by the Stakeholder Relations group. The definition of a customer used by JEN is consistent with the STPIS definition, being defined as a premise having an assigned National Metering Identifier (NMI).

The customer numbers used for the calculation of STPIS metrics are updated at the start of each month and used for the purpose of daily and monthly internal reporting for that month. Consistent with the RIN definitions, the total customer number used for reporting annual reliability measures is the simple average of the customer numbers at the beginning and end of the reporting period.

Non metered supplies which are included in the Network Model are included in the count of the number of customers interrupted by an outage, but street lighting is not included.

Low voltage customers with a smart meter installed as part of the Advanced Metering Infrastructure (AMI) project are captured in SAP and are reported by running a query through COGNOS. All other low voltage customers are captured in the CIS+ system and are reported by extracting the data from CIS+ into an Excel spread sheet.

The Urban/Rural split utilised for RIN reporting is based on the number of customers in the Network Feeder Model. The proportional split of customers is applied to the numbers extracted from the billing system.

The customer numbers from CIS+, AMI and Stakeholder Relations are manually entered into the reporting spread sheet.

The process is captured in the procedure *JEN AER Customer Numbers Procedure JEN PR 0017*. This procedure was applied for the 2013 RIN data.

2.2.4 Unplanned outages

Two systems capture unplanned outage information. These systems cover telemetered and non-telemetered devices.

All telemetered devices (which include substation circuit breakers and remote controllable switches) are connected to OMS via SCADA and the opening and closing of the devices are recorded automatically with a date and time stamp. The number of customers affected is calculated by OMS based on the customers attached downstream from the opened switch as described in the network model. The start time of an outage associated with a telemetered device is taken as the timestamp associated with the opening of that device.

For non-telemetered devices, the start time of an outage is recorded as the time of the first customer call reporting an interruption to supply.

The end time of the outage is taken as the time of closing the HV or LV switching device that restores supply, as reported by the field crew undertaking the switching activity. This includes staged restorations where the actual number of customers to which supply is restored is recorded at each stage.

Network operators record restoration times on the OIW form immediately when receiving calls from field crews. There can be a time delay before the Network Controllers are able to update the network model with the actual status of the switches. During the end of month validation process, the switching time that is automatically recorded in OMS is checked against the OIW logs and updated if required.

Single phase losses are given the following treatment:

- HV single phase loss causes outage to 67% of load (phase to phase connections)
- LV single phase loss causes outage to 33% of load (phase to neutral connections)
- Interruptions to a single premise are included in the calculation of SAIDI and SAIFI
- Temporary changes to system normal configurations are taken into account when determining the number of customers interrupted through updating the Network Model.

At the end of each month, the data in OMS is exported to CMOS where it is subject to a verification and data cleansing process. Minor issues are only corrected in the CMOS database but major issues are resolved by the network controller in the OMS

- outages are checked to ensure staged restorations are counted as one fault, rather than multiple outages
- feeder ACR operations are checked against the OMS 59 report, OIW and network controller logs
- all outages with durations less than 30 minutes or greater than 600 minutes (potential outliers) are checked to ensure they are correct and not due to manual transcription or other errors
- due to the delay between receiving a switching confirmation and updating the network model, actual switching times are verified against OIW and the controllers log book
- OMS has a time discrimination limitation in recognising when two switches operate close together, i.e. an ACR and its upstream CB. This is adjusted once data is in CMOS.

The number of customers interrupted is identified by OMS through the Network Model. This includes temporary load transfers and disconnections.

The verification process is captured in the procedure *JEN AER Network Reliability Reporting Procedure, JEN PR 0502*. This procedure was applied for the 2013 RIN data.

2.2.5 Planned outages

Planned outages are requested via the Works Scheduling System WSS. The control centre planner drafts a switching instruction. On the day of the planned interruption, the controller directs the field crew who undertake the switching activity. The times of the interruption are recorded in the control room. The controller then records the switching times in OMS.

2.2.6 Cause codes for outage data

When an event occurs on the network, OMS requires a cause code to be entered. The details of the event are entered into OMS by the Network Controller as the event is being rectified.

During the 2013 audit period, JEN used cause codes that had been developed internally to provide sufficient information for reliability strategy planning. However, the AER has specified that different cause codes are to be reported as part of the RIN.

JEN undertook a review process:

- to confirm cause codes that were reported
- assess the causes for events which did not have a cause code and allocate an appropriate code
- map the internal cause codes to the AER cause codes.

Cause codes were included in the monthly data verification and cleansing processes and were verified again at the end of year when assembling the RIN data.

The cause code capture, mapping and verification process is captured in the procedure *JEN AER Network Reliability Reporting Procedure, JEN PR 0502*. This procedure was applied for the 2013 RIN data.

2.2.7 Extracting data for calculating reliability measures

The COGNOS application extracts data from the OMS database according to predefined filters. The extracted data is imported to the CMOS Access database and a report is run monthly for internal reporting and annually for RIN reporting.

Prior to running the annual report, a data cleansing process is undertaken aimed at improving data accuracy. The data is verified and cleansed to correct anomalies or known errors, such as time stamps for manual switch changes where a more accurate time is stored in another location, such as the OIW.

A change log is run monthly to capture all changes to the CMOS data made as part of the cleansing and verifying process

To define the number of customers in each feeder category, the proportion of customers allocated to Rural Short and Urban feeder types in the Network Model is applied to the more accurate total customer numbers extracted from the billing information systems.

The process used for data extraction from OMS and verification of the extracted data in Excel and again in an Access database are described in the procedure *JEN AER Network Reliability Reporting Procedure, JEN PR 0502*. This procedure was applied for the 2013 RIN data. This procedure also describes the process used to fill in Templates 1a and 1c.

2.2.8 Definition of reliability measures

JEN reports on the three reliability measures using the AER definitions as defined below:

System Average Interruption Duration Index (SAIDI):

$$\frac{\sum_{1\ Jan\ 2013}^{31\ Dec\ 2013} Actual\ affected\ customer\ numbers\ \times Acutal\ interuption\ duration}{Simple\ average\ of\ annual\ customer\ numbers}$$

System Average Interruption Frequency Index (SAIFI):

$$\frac{\sum_{1\ Jan\ 2013}^{31\ Dec\ 2013} Actual\ number\ of\ customers\ interrupted}{Simple\ average\ of\ annual\ customer\ numbers}$$

Momentary Average Interruption Frequency Index (MAIFIe):

$$\frac{\sum_{1\ Jan\ 2013}^{31\ Dec\ 2013} Actual\ number\ of\ customers\ interruptions\ \leq 1minute}{Simple\ average\ of\ annual\ customer\ numbers}$$

The calculations of SAIDI and SAIFI exclude momentary outages.

Customer numbers used for the numerator of the calculations are taken from OMS and are the customer numbers on the affected feeder as defined in the Network Model. The customer numbers used in the denominator are those from the billing information systems as described in the Definition of Customers section above.

All data used to calculate reliability measures is obtained from the verified and cleansed CMOS data.

All reclosers on the JEN network are telemetered so all data for the calculation of MAIFI is obtained through OMS. Only 5 reclosers on the JEN network have multi reclose functions enabled, all others only have one attempt to reclose before they lock out (remain open).

2.2.9 MED threshold

The MED boundary is calculated based on the daily SAIDI contribution (i.e. excluding momentary outages) for the previous 5 year period as defined by the AER and the 2.5β Methodology. The daily performance data is entered into the RIN Template 1c and the 5 year daily SAIDI history, excluding the Section3.3(a) exclusions, is entered into the RIN Template 1d. A formula automatically calculates and identifies the MEDs.

2.2.10 Exclusions

Events may be excluded from the reliability measure calculations if the SAIDI on that day exceeds the Major Event Day threshold or if they meet the definitions for Exclusion categories as defined by the AER in Section 3.3(a) of the STPIS.

Events that meet the criterion for exclusion from the calculation of the reliability parameters are identified by the Senior Asset Performance Engineer and are confirmed with the TNSP (SP AusNet) and are then notated in CMOS.

The process used for gathering data required for exclusions is described in the procedure *JEN AER Network Reliability Reporting Procedure, JEN PR 0502* for Template 1e, and *JEN AER RIN Non-Financial Information Reporting Procedure, JEN PR 0503* for Template 1d. This procedure was applied for the 2013 RIN data.

2.3 Objective evidence

The following evidence supports the findings.

2.3.2 General

- There has been minimal change in the systems and processes used in the 2013 audit period compared to those used in the 2012 audit period. The significant changes were:
  - The process of calculating the STPIS reliability parameters is predominantly undertaken by one staff member, however, Jemena confirmed that a second staff member has been trained to undertake the task and has been involved in reviewing the task. This is a significant improvement from the 2012 audit where the process was largely reliant on only one staff member and the 2011 audit where the entire process was reliant on only one staff member.
- The auditor tracked the outage events of 1 October 2013 through the outage management systems from OMS and into the CMOS database[1]. The auditor found the data transferred between the systems to be consistent and follow the processes described. The auditor also confirmed that the events of this day exceed the MED threshold as reported by JEN.
- The auditor tracked an outage event through the outage management systems from SCADA records, through the event rectification process, to OMS[2], into the CMOS database[3] and into the

[1] JEN 1 October 2013 outage data.xlsx

[2] cognos.pdf

[3] Sep 13.xlsx

Daily Situation Report[4]. The auditor found the data transferred between the systems to be consistent, with no material inconsistencies and follow the processes described. The outage event sampled was Trouble Order number 79638 and was related to the outage of the feeder YTS06.

- The auditor tracked an outage event through the outage management systems OMS[5] and into the CMOS database[6]. The auditor found the data transferred between the systems to be consistent, with no material inconsistencies and follow the processes described. The outage event sampled was Trouble Order number 79066 and was related to the outage of the feeder COO11.
- The auditor tracked an outage event through the outage management systems from SCADA records[7], through the event rectification process, to OMS[8], into the CMOS database[9] and into the Daily Situation Report[10]. The auditor found the data transferred between the systems to be consistent, with no material inconsistencies and follow the processes described. The outage event sampled was Trouble Order number 86306 and was related to the outage of the feeder EP 36.
- The auditor tracked an outage event through the outage management systems OMS[11] and into the RIN template. The auditor found the data transferred between the systems to be consistent, with no material inconsistencies and follow the processes described. The outage event sampled was related to the outage of the feeder CN 04.

2.3.3 Definition of feeder categories

- The processes, systems and definitions used to identify feeders were well understood by the staff members who consistently applied the same methodology.
- The data requires manual extraction and manipulation once it is in Excel spread sheet format. This introduces the possibility that human/transcription errors could be made. The auditor also noted that subjective decision making was required when allocating feeder types to some feeders, specifically the shared feeders from zone substation SA.
- A data verification process is undertaken, with a particular focus on the shared feeders (Powercor) and feeders close to the boundary of the definitions.

2.3.4 Customer numbers

Table 2.2 shows the information reported by JEN in the RIN.

- Formal procedures[12] have been written for all aspects of gathering, manipulating and verifying data relevant to the customer numbers parameters. These were provided to the auditor and assessed to be appropriate and fit for purpose. The auditor notes that these procedures were the same procedures provided during the 2012 audit, written retrospectively for the 2012 audit period; the procedures were current for the 2013 audit period.

[12] JEN AER Customer Numbers Procedure JEN PR 0017

Table 2.2 Average distribution customer numbers

	CBD	Urban	Rural short	Rural long	Whole network
Customer numbers at the start of period		306,645	12,721		319,366
Customer numbers at the end of period		305,483	12,811		318,294
Average distribution customer numbers	0	306,064	12,766	0	318,830

Source: RIN Template 1a. STPIS Reliability, Table 5: Average distribution customer numbers

- The processes and systems used to identify customers were well understood by the staff member who consistently applied the same methodology.
- The auditor observed that JEN used the correct definitions for customers when calculating STPIS reliability measures.
- The data requires manual extraction and manipulation once it is in Excel spread sheet format. This introduces the possibility that human/transcription errors could be made.
- Verification involves a sanity check of the number of meters by the person extracting the data, with no verification by another party.
- The STPIS states that non-metered supplies can either be included or excluded when calculating SAIDI and SAIFI. In the reported RIN figures, when determining the number of customers affected by an outage, non-metered supplies that are included in the Network Model were included. There is a difference of approximately 2,518 customers (~0.8%) between the customer numbers derived from the billing system when compared to the Network Model. Most of these are thought to be due to non-metered supplies. This is due to:
  - The software in the Network Model not recognising a customer connection point that has been imported from GIS. These are rectified when found, but there is no formal process.
  - Disconnections are removed from the count of customers if enough time has elapsed to allow the updating of the network model from GIS.
  - Not all unmetered supplies are included in the network model.
- An estimation of the number of customers was identified in October 2013. This was estimated as the number of customers in September 2013 and is likely to have resulted in over-reporting in October 2013. However, the error only affected the monthly internal reporting. The customer numbers for December 2012 and December 2013 were unaffected.

2.3.5 Identifying unplanned outages and calculating reliability measures

- The process of calculating, verifying and correcting outages and times is undertaken as detailed in JEN PR 0502.
- The systems and processes are well understood by the staff members who complete these tasks, and correct definitions were applied to calculate the reliability measures.
- During 2013 JEN used cause codes that were specified internally. JEN undertook a verification process monthly and at the end of the year to map them to the cause codes specified by the AER. The auditor considers that the process undertaken was satisfactory.
- Temporarily disconnected premises and temporary load transfers are included in the count of customers interrupted until the abnormal configuration has been updated into GIS. This may impact the accuracy of reliability figures.

- The difference of 2,518 customers between the network model and the customer information systems, as described in section 2.3.4, results in an understatement of approximately 0.8% of the reliability measures.
- Formal procedures exist governing the recording of outages and times from non-telemetered assets, for staff members in the control room. In the 2011 RIN audit, the auditor sampled some outages from CMOS and traced them back to the control room daily log. JEN confirms that no change has been made to these recording practices. From this sample, the auditor is satisfied that the procedures are followed correctly.
- There is a comprehensive data validation and cleansing process undertaken each month to ensure accurate times have been recorded for non-telemetered devices. Data validation sources include source data from OIW, Control Desk Daily Logs and the Daily Situation Reports. The auditor has viewed the process documented in the procedure, viewed evidence that the verification process had been undertaken during the 2013 period and noted that the changes are tracked.

2.3.5.1 Unplanned SAIDI

Table 2.3 shows the information reported by JEN in the RIN.

Table 2.3 SAIDI (System Average Interruption Duration Index)

Unplanned SAIDI [1] (refer note)	Network categorisation				
	CBD	Urban	Rural short	Rural long	Whole network
Total		64.67	114.42		66.66
Total (after removing excluded events and MED)		57.51	114.39		59.79

Source: RIN Template 1a. STPIS Reliability, Table 1: SAIDI (System Average Interruption Duration Index)

- The auditor was able to repeat the above results with the data supplied.

2.3.5.2 Unplanned SAIFI

Table 2.4 shows the information reported by JEN in the RIN.

Table 2.4 SAIFI (System Average Interruption Frequency Index)

Unplanned SAIFI [2] (refer note)	Network categorisation				
	CBD	Urban	Rural short	Rural long	Whole network
Total		1.12	2.42		1.18

Source: RIN Template 1a. STPIS Reliability, Table 2: SAIFI (System Average Interruption Frequency Index)

- The auditor was able to repeat the above results with the data supplied.

2.3.5.3 Unplanned MAIFI

Table 2.5 shows the information reported by JEN in the RIN.

Table 2.5 MAIFI (Momentary Average Interruption Frequency Index)

Unplanned MAIFI[3] (refer note)	Network categorisation				
	CBD	Urban	Rural short	Rural long	Whole network
Total		0.71	2.39		0.78
Total (after removing excluded events and MED)		0.70	2.39		0.77

Source: RIN Template 1a. STPIS Reliability, Table 3: MAIFI (Momentary Average Interruption Frequency Index)

- The auditor was able to repeat the above results with the data supplied.

2.3.5.4 Planned Outages

Table 2.6 shows the information reported by JEN in the RIN.

Table 2.6 Planned outages

Planned outages	Network categorisation				
	CBD	Urban	Rural short	Rural long	Whole network
SAIDI		21.79	66.87		23.59
SAIFI		0.08	0.27		0.09

Source: RIN Template 1a. STPIS Reliability, Table 4: Planned outages

- The auditor was able to repeat the above results with the data supplied.
- For details of GSL payments relating to planned outages, refer to section 3.2.7.

2.3.5.5 MED threshold

Table 2.7 shows the information reported by JEN in the RIN.

Table 2.7 MED Threshold

MED Threshold (Timed) year ending 31 December	5.05

Source: RIN Template 1d. STPIS MED Threshold, Table 1 MED Threshold

- The Major Event Day (MED) threshold was correctly defined and calculated. There was 1 MED during the 2013 period.
- The "Network SAIDI All events" values for 2008-2011 used to calculate the 2013 MED threshold were consistent with those used to calculate the 2012 MED threshold.

2.3.5.6 Exclusions

- Exclusions were correctly defined. There were no exclusions (Section 3.3(a)) identified during the 2013 period. The auditor notes that the process relating to identification of exclusions and their inclusion in the calculation of reliability measures is included in JEN PR 0502.

2.4 Audit Findings

For the 2013 audit period, JEN's reported reliability parameter data have been found to comply with the definitions contained in the STPIS and have been assigned the audit grades outlined in Table 2.8.

These audit findings are supported by the objective evidence in Section 2.3.

Table 2.8 JEN compliance grade for STPIS reliability parameters

Item	Criterion 1 Reliability	Criterion 2 Documentation	Criterion 3 Understanding	Criterion 4 Definitions	Criterion 5 Error Correction	Criterion 6 Repeatability	Result	Comment

3. STPIS – customer service parameters

This section outlines the auditor's assessment of the reliability and robustness of systems, processes and procedures used by JEN to report on Customer Service components of the RIN (Template 1b of the RIN).

3.1 Summary of audit requirement

The auditor is to assess whether the processes, procedures and systems were correctly used and applied by the relevant staff, and that the definitions and data exclusions were in accordance with the STPIS. Further, the auditor must assess whether the systems used are able to competently identify and correct errors, and if the RIN templates being audited show any corrections.

The auditable information includes:

- telephone answering data:
  - total number of calls received and
  - number of calls answered within 30 seconds (with exclusions)
- new connections data:
  - number of new connections
  - number of new connections not provided on or before the agreed date.
- street light repair data:
  - number of streetlights
  - number of faults
  - number of streetlights repaired within the relevant
- GSL reporting (relating to the planned interruptions parameter only):
  - Number of appointments arranged and attended on time for AMI and non AMI meters
  - number of connections not made within the agreed date

- reliability of supply payments (excessive duration of frequency)
- number of street lights not repaired within required timeframe
- number of occasions a notice of planned interruption to supply was not given on or before the threshold.

3.2 Overview of data systems

3.2.1 Telephone answering

Template 1c requires the daily number of calls received to be provided.

JEN has outsourced its telephone answering service to an external service provider, AEGIS. AEGIS performs four main functions:

- Identifies incoming calls as JEN customers
- Provides an interactive system to play messages and route calls to operators
- Records call data and provide reports to JEN
- Provides information to JEN regarding faults reported by customers.

AEGIS's system comprises three main components as shown in Figure 3-1 below. AVAYA is the system which accepts the calls. It has a Dialled Number Identification Service (DNIS) which recognises the callers as JEN customers based on the number dialled, and can use the DNIS to provide a location based on the incoming caller ID, and logs the call times. AVAYA has its own database.

AVP provides the user self-serve selection facilities which plays messages relevant to the area of the post code entered by the customer and routes the customers to the relevant operators. AVP has its own database and tracks the phone calls through each step, by assigning a Unique Caller Identification Number (UCID) and a time stamp at each step. The calls can then be individually traced if required.

The calls are then transferred to another system where they are queued for an operator.

The reporting of calls and histories is done through a predefined data base query script with the definitions defined as agreed with JEN in the service level contract. The key definitions are:

- if caller hangs up after the start of a message and ≤ 30 second after the message has finished then it is classed as 'Self-Serve'
- if a caller hangs up prior to being placed in the queue for an operator, excluding the time window of 'Self Serve', the call is classed as abandoned ≤30 seconds
- once in the queue for an operator, the time starts to count from 0 seconds.

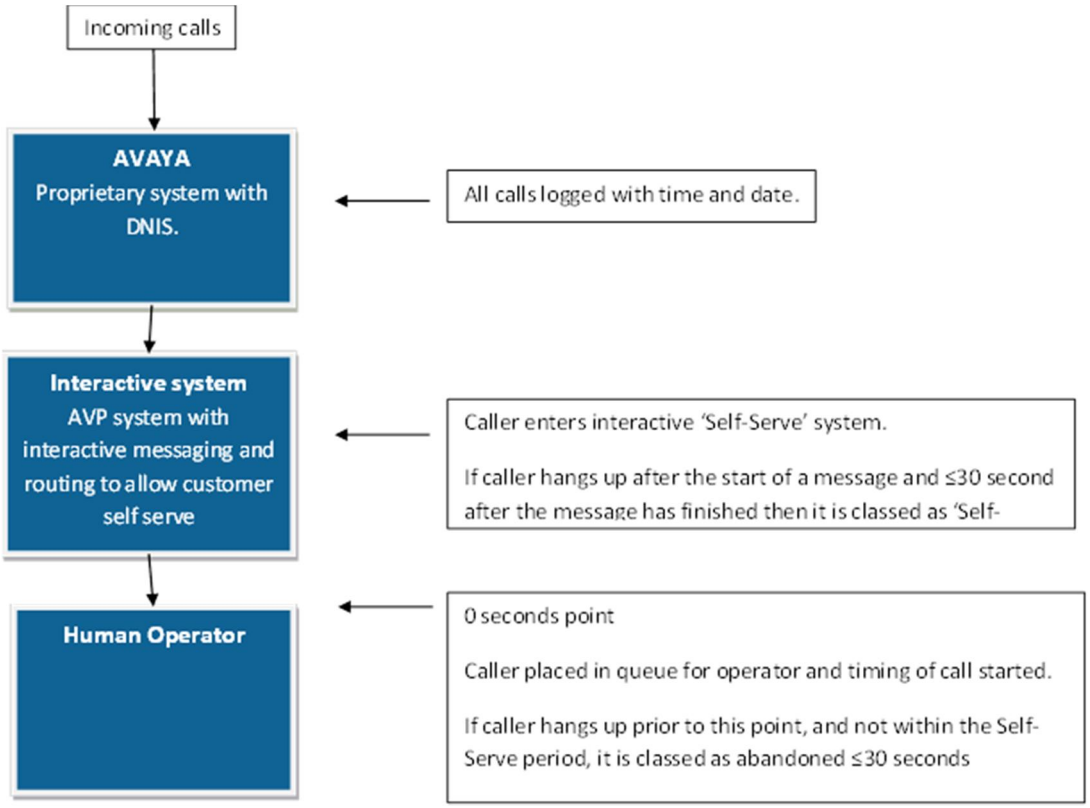

Figure 3-1 Flow diagram of telephone answering system

3.2.2 New connections

New customer connection data is stored in two databases:

- CIS+ – is a system which stores customer data but this data has been transitioning to SAP since 2010 whenever a customer meter is changed into a smart meter as part of the AMI project. Note some customers (predominantly large usage customers) are not within the scope of the AMI project and will remain in the CIS+ system in the foreseeable future.
- SAP – the new system replacing CIS+. Data for customers with smart meters is entered into SAP.

The process to capture the new connections data is initiated by the retailer by sending an electronic service order followed by hard copy paper work to JEN. The paperwork explicitly states the job is a New Connection and includes any permits required. All new connections are processed through SAP. JEN verifies the electronic and hard copy forms against each other and checks in SAP and CIS+ to ensure the connection does not already exist. Once entered into SAP, the new connection order is tracked through SAP and will be shown as outstanding/incomplete service order.

Both the electronic and hard copy must be received for the service order to be progressed in the JEN systems. Once the service order is accepted the 10 day period allowed by the GSLs starts to accrue.

The service order is entered into SAP by JEN and manually issued to field crews who must acknowledge receipt. The target date is set at 2 days as a standard, but can be negotiated with the contractor if required.

The actual completion date is recorded by SAP when the service order is closed.

The number of new connections is reported monthly. The report for new connections is run on the 3rd day of each month. The reporting process is semi-automated; SAP completed service orders are export to a spread sheet and manually filtered to isolate new connection numbers

Complaints regarding new connections are received and registered via the call centre.

3.2.3 Disconnections (Abolishments)

Disconnections can include either electrical disconnection where a switch is opened to stop electricity supply to a customer (de-energisation), or it can include the physical removal of the electrical conductor and associate equipment (abolishment).

JEN has understood the disconnections reporting field in the RIN to be the number of abolishments.

Customer disconnection data is stored in two databases:

- CIS+ – is a system which stores customer data but has been transitioning to SAP since 2010.
- SAP – the new system replacing CIS+. Data for customers with smart meters is entered into SAP.

The process to capture disconnections (abolishments) is initiated by the retailer by sending an electronic service order followed by hard copy paper work to JEN. The paperwork explicitly states the job is a disconnection (abolishment), contains the NMI and permits required for working on the network. JEN verifies the electronic and hard copy forms against each other and checks in SAP and CIS+ to ensure the connection exist. Once entered into SAP, the disconnection (abolishment) order is tracked through CIS+/SAP and will be shown as outstanding/incomplete service order.

Once the meter number is validated and all forms are received, JEN contacts the contractor and organises the target disconnection (abolishment) date, normally set for 2 days unless otherwise negotiated.

If an appointment is scheduled, disconnection (abolishment) is scheduled in Microsoft Outlook, which is used as a reconciliation tool to assess the number of disconnections (abolishments).

3.2.4 Street light repair

Streetlight locations and numbers are recorded in GIS and imported into SAP. A BRIO query is run to extract the streetlight data from SAP into an excel spread sheet which is used to calculate the required volume and fault measures.

Streetlight data is updated during bulk light replacements. The public lighting contractor uses ‘tough books’ to check data against GIS when in the field and update if required

Additional data reliability checks are required by JEN as an annual sample audit under the Metrology process. Further, councils have access to public lighting data through a web application and can therefore complete their own audits and report faults.

Streetlight faults reported by the public are recorded and addressed by the following process:

- Customer contacts the call centre regarding streetlight fault.
- Call centre operator opens GIS web application, locates the public light and starts the editor to create a faulty streetlight notification. The notification includes the location and repair code, and is then transferred electronically to create a SAP notification. There are two types of repair codes:
  - G = GSL applicable, 2 days to repair, outside or adjacent to the complainants residence

- P = no GSL payment applicable, 7 days to repair, all other cases.

- The public lighting contractor monitors the SAP public lighting output and dispatches a field crew to correct problem.
- The contractor updates SAP with close out date/time to remove the notification.

The street light report is run at the start of each month for the previous month and at the start of the year for the previous year. The yearly report is compared with the aggregate of the monthly reports for the purposes of RIN reporting.

3.2.5 Appointments

Appointments are made as required, typically where there are access issues for meter reads, alterations on-site or a new connection. Appointments for AMI are completed using a separate system.

The JEN Service Desk schedules the appointments with the customer and records the date in Outlook and the customer's account in either CIS+ or SAP.

The contractor must email JEN the job details after attending the appointment, including arrival time. The arrival time is stored in the customer's account details and is extracted by running queries through CIS+ and SAP. The outputs from the two systems are added manually in a spread sheet.

AMI appointments are logged through the external vendor Service Stream. Service Stream provides notification to the customer with a letter notifying of their requirement to access the property 10 days prior to the AMI installation. The customer can contact Service Stream to negotiate a different date.

The work order is logged in the Service Stream system and dispatched to work crews electronically on their PDA. The arrival of the work crews is registered on the PDA and the report relating to attendance of appointments is sent to JEN weekly. During the audit period, the reporting method was transferred from emailing Excel spread sheets to a B2B interface.

3.2.6 GSLs for Unplanned interruptions

The process of capturing unplanned outage data is described in Section Unplanned outages2.2.4. The GSLs for unplanned data require a different analysis to assess the total duration and number of interruptions during the reporting period.

Analysis for GSL purposes was completed once at the start of 2014 using all the 2013 data. Queries were run to extract data from OMS and import it into an Excel spread sheet.

The outages can also be viewed using the application called 'Outage Web' which is used for verification and reconciliation purposes.

3.2.7 Notification of Planned outages

Network outages are identified as either planned or unplanned. A planned outage includes all prearranged outages, including those prearranged outages where customers were not provided with the required notification. All other outages are classified as unplanned.

The LV operations group located in Broadmeadows is responsible for notifying customers who will be affected by a planned outage. The number reported in the RIN is the number of customers who did not receive the specified period of notice prior to commencement of the outage.

The following process is undertaken to identify and notify customers that will be affected:

- the field crew inspects the site
- creates outage cards
- assesses GIS for the customers connected to the affected plant
- the LV operations group then hand delivers notifications to residents who are expected to be affected by the planned outage.

Customers who are not notified can either communicate directly to the field crew who immediately pass the information on to an operator at the control room desk, or call the call centre where it is logged and sent to the dispatcher in the control room.

3.3 Objective Evidence

The following evidence supports the findings.

3.3.2 Telephone answering

The information reported by JEN in the RIN is shown in Table 3.1

Table 3.1 Telephone answering

Telephone answering	Total	Total after removing MED
Number of calls received	76,248	74,599
Number of calls answered within 30 seconds	47,151	46,960
Percentage of calls answered within 30 seconds	61.84%	62.95%

Source: RIN Template 1b. STPIS Customer Service, Table 1: Telephone answering

- Two procedures were supplied during this audit that were sighted during the previous audit:
  - The procedure JEN PR 0503 provides the definitions of the calculations undertaken for the reported data.
  - The procedure JEM-W-2960.3 covers the process to extract, manipulate and distribute the telephone call system data.
- The auditor confirmed that no change had been made to the process of extracting data from the telephone systems since the last audit. Hence, the auditor relied on the 2012 RIN audit that found the data definitions of extracted data were in accordance with the RIN requirements.
- The auditor followed the data through from daily reporting, to monthly values and the yearly reported statistics. The auditor found the data transferred between the systems to be consistent, with no material inconsistencies and follow the processes described. The data sampled was related to the telephone answering of January 2013 and Dec 2013.
- The processes and systems used to create the reported data were well understood by staff who consistently applied the same methodology.

3.3.3 New connections

The information reported by JEN in the RIN is shown in Table 3.2

Table 3.2 New connections

New connections	Total
Number of new connections	7,409
Number of new connections not provided on or before the agreed date	5
Percentage of new connections not provided on or before the agreed date	0.07%

Source: RIN Template 1b. STPIS Customer Service, Table 2: New connections

- Three procedures regarding new connections were provided to the auditor. The procedure JEM-P-4900-03 describes the procedure for creating new connections related to non-AMI meters in CIS+. The procedure JEM-P-4900-60a covered the creation of new connections related to the AMI meters in SAP. The procedure JEM-P-4900-98 describes the procedure for monthly reporting on new connections.
- The processes and systems used to identify customers were well understood by staff who consistently applied the same methodology.
- The process uses minimal automation and is heavily paper based increasing the possibility for human errors to be introduced.
- The monthly report cannot be re-run to audit data from that month. This limits the ability of staff to assess data for errors retrospectively.

- No evidence was provided to the auditor to prove the system captures retrospective changes to completion dates.
- Monthly reports are aggregated to provide the yearly reporting data. No validation is undertaken from the original information source.
- The auditor reviewed SAP data for all new connections not made within 10 days. In 2013, 3 new connections in SAP were paid GSLs for missed connections. A further 448 new connections exceeded the 10 day threshold, with acceptable reasons for connections outside of the 10 working days.
- The auditor reviewed an extract of CIS+ data for all new connections not made within 10 days. In 2013, 2 new connections in CIS+ were paid GSLs for missed connections

3.3.4 Disconnections (Abolishments)

- The auditor confirmed that the systems and processes used for recording and reporting disconnections have not changed since the previous audit.
- The procedure JEM-P-4900-08 covers creating an abolishment service order to initiate a service abolishment.
- The processes and systems used to identify customers were well understood by staff who consistently applied the same methodology.
- Disconnections were correctly identified from the data extracted from the information systems.
- The process uses minimal automation and is heavily paper based increasing the possibility for human errors to be introduced. The auditor does not consider this a robust process.

3.3.5 Street light repair

The information reported by JEN in the RIN is shown in Table 3.3

Table 3.3 Streetlight repair

Streetlight repair	Total
Total number of streetlights	69,058
Total number of streetlight faults	3,054
Total number of streetlight faults reported by person who is the occupier of an immediately neighbouring residence or is the proprietor of an immediately neighbouring business	952
Faulty streetlights not repaired within 2 business days of fault report or agreed date	2
Percentage of faulty streetlights not repaired within 2 business days of fault report or agreed date	0.07%

Source: RIN Template 1b. STPIS Customer Service, Table 3: Streetlight repair

- The procedure, JEN PR 0500, relating to the reporting of all street light data relevant to Tables 3 and 4 in Template 1b of the RIN has been provided and the auditor considers it adequate. This procedure has been updated since the 2012 audit period to include an additional section on year end data checks. This is an improvement on the 2012 audit year.
- The processes and systems used to identify customers were well understood by staff who consistently applied the same methodology.
- The data needs to be manually inserted into the street lights spread sheet, but minimal analysis and manipulation is required.
- The definitions applied are consistent with the STPIS as required by the RIN.
- The auditor followed to notifications through from the yearly reported data, through the GIS system and into a SAP notification. The auditor found the data transferred between the systems to be

consistent, with no material inconsistencies and follow the processes described. The data sampled was related to notifications 10198970 and 10206753.

3.3.6 Appointments

- The process of making and tracking appointments and applying GSLs was confirmed to not have changed since the previous audit.
- Two formal procedures apply to the recording of appointments and the application of GSLs for missed appointments
  - Module 84e MRO Missed Appointments JEM-P5-S2-563 which focuses on AMI meters(this procedure has been updated but has been confirmed to contain no material changes since the 2012 audit)
  - GSL Payments Procedure New Connections JEM-P-4900-34 which focusses on appointments for new connections.
- The processes and systems used to identify customers were well understood by staff who consistently applied the same methodology.
- The correct definitions were used relating to late arrival to appointments.
- The process currently in place for non-AMI appointments relies heavily on paper work and manual entry of information. It also relies on the honesty and accuracy of the contractors reporting their arrival time. The auditor does not consider this a robust process.
- Verification of arrival times is only assessed through customer complaints and a monthly reconciliation undertaken by the Service Desk to compare the appointments in Outlook to the appointments that have been attended by the service providers.
- Select Solutions also undertakes periodic audits of appointments.

3.3.7 Unplanned interruptions

- The procedure JEN PR 0113 was provided. It was confirmed that there were no material changes to this procedure since the 2012 audit.
- The processes and systems used to extract data and identify customers eligible for GSL payments due to reliability were well understood by staff and they consistently applied the same methodology.
- The times of the outages and any inconsistencies in CMOS are verified against ‘Outage Web’. The auditor observed the process and is satisfied it is robust.
- Correct definitions for the durations, interruptions and payments were shown to be applied in the informal procedure.
- Although the overall process used is considered robust, the auditor notes that it could be improved by leaving a better audit trail of any changes made.

3.3.8 Planned outages

- The procedures Planned Interruption Notification Policy IME 1057 was confirmed to have no material changes since the 2012 audit.
- The new procedure Planned Interruption Notification Procedure, which was current during the 2013 audit period, was provided to the auditor. The auditor reviewed the procedure and found that it did not outline the obligation to provide notice for planned outages. The auditor notes that the policy and procedure principles have been incorporated into a new document, CoC Planned Interruption

Customer Notification JEN-PR-9667, which will be utilised for the 2014 audit period. The auditor reviewed this document and assessed it to be appropriate and fit for purpose.

- The processes and systems used to notify customers of planned outages are well understood by staff and are consistently applied.
- The procedure correctly identifies the notification period to be 4 days prior to the planned outage. The auditor noted this was identified in the Planned Interruption Notification Policy.
- The only verification available that all customers were notified is through complaints received by JEN either through the field crews or through the call centre, where it is noted as a fault. Given the robustness of the complaints recording process, the auditor is satisfied that this is a satisfactory system.
- The predominant reason for failing to notify customers of outages is if the customer is shown in GIS to be located on the wrong side of an LV open point. The auditor understands that sometimes it is necessary to relocate a customer's attachment point for load balancing/supply quality purposes. The auditor considers that, in order to improve the notification of planned outages, a stronger focus should be placed on recording these changes in GIS.
- The auditor noted that planned interruptions that were not notified are also included in the unplanned outages, but considers this duplication to be insignificant.
- The auditor sited the planned interruptions 4 days' notice not given for 2013.

3.3.9 GSLs (jurisdictional scheme)

The information reported by JEN in the RIN is shown in Table 3.4.

Table 3.4 Guaranteed service levels - jurisdictional GSL scheme

Appointments (excluding AMI)	
Customer arranged appointments Central - number	3,629
Appointments not met within 15 minutes of agreed time - number	22
Appointments - GSL payments - number	22
Appointments - GSL payments - ($)	$ 440.00
Appointments (AMI only)	
Customer arranged appointments Central - number	32,588
Appointments not met within 15 minutes of agreed time - number	1,180
Appointments - GSL payments - number	1,180
Appointments - GSL payments - ($)	$ 23,600.00
Connections	
Connections made	7,409
Connections not made on agreed date	5
Connections - GSL payments - 1-4 day delay - number	3
Connections - GSL payments - 1-4 day delay - ($)	$ 250.00
Connections - GSL payments - 5+ day delay - number	2
Connections - GSL payments - 5+ day delay - ($)	$ 500.00
Reliability of supply	
Low reliability payments - 20 hours - number	340
Low reliability payments - 20 hours - ($)	$ 34,000.00
Low reliability payments - 30 hours - number	28
Low reliability payments - 30 hours - ($)	$ 4,200.00
Low reliability payments - 60 hours - number	0
Low reliability payments - 60 hours - ($)	$ -
Low reliability payments - 10 events - number	0
Low reliability payments - 10 events - ($)	$ -

Low reliability payments - 15 events - number	0
Low reliability payments - 15 events - ($)	$ -
Low reliability payments - 30 events - number	0
Low reliability payments - 30 events - ($)	$ -
Low reliability payments - 24 momentary events - number	0
Low reliability payments - 24 momentary events - ($)	$ -
Low reliability payments - 36 momentary events - number	0
Low reliability payments - 36 momentary events - ($)	$ -
Street lights	
Street lights	69,058
Street lights "out" during period	3,054
Street lights not repaired by "fix by" date	4
Street lights not repaired in 2 business days	1,568
Street lights – number of business days to repair	3.3
Street lights - GSL payments - number	2
Street lights - GSL payments - ($)	$ 20.00
Planned interruptions	
Planned interruptions - 4 business days notice not given	61
Total GSL payments made ($)	**$ 63,010.00**

3.4 Audit Findings

For the 2013 audit period, JEN's reported customer service parameter data have generally been found to comply with the definitions contained in the STPIS and have been assigned the audit grades outlined in Table 3.5.

Table 3.5 JEN compliance grade for STPIS customer service parameters

Item	Criterion 1 Reliability	Criterion 2 Documentation	Criterion 3 Understanding	Criterion 4 Definitions	Criterion 5 Error Correction	Criterion 5 Repeatability	Result	Comments
Telephone answering	●	●	●	●	●	●	Compliant	
New connections	●	●	●	●	●	●	Compliant	Heavily paper based process Weak verification process
Street light repair	●	●	●	●	●	●	Compliant	
GSLs (jurisdictional scheme)								
■ Appointments (ex AMI)	●	●	●	●	●	●	Compliant	Heavily paper based process and recording of appointment arrival times not robust Weak verification process
■ Appointments (AMI only)	●	●	●	●	●	●	Compliant	Weak verification process
■ Duration	●	●	●	●	●	●	Compliant	
■ Sustained interruptions	●	●	●	●	●	●	Compliant	
■ Momentary interruptions	●	●	●	●	●	●	Compliant	
■ Street lights	●	●	●	●	●	●	Compliant	
■ Planned interruptions	●	●	●	●	●	●	Compliant	Notification step absent from notification procedure

Jemena Electricity Networks (Vic) Ltd

Response to the annual Regulatory Information Notice for the 2013 regulatory year

Appendix 1-9

JEN board resolution

Public

30 April 2014

Extract of Minutes of Meeting of the Jemena Electricity Networks (Vic) Limited (ACN 064 651 083) Board held at 11:04 am (AEST) on 16 April 2014 at the Company's offices at 321 Ferntree Gully Road, Mt Waverley, Victoria.

*I, Tina Ooi, Company Secretary of Jemena Electricity Networks (Vic) Limited (**Company**) certify:*

(i) that this is a true and correct extract of the resolutions approved by the Company's Board, at a duly convened and constituted meeting, held at the Company's offices on 16 April 2014; and

(ii) the resolutions have not been amended or revoked.

Jemena
Vital Service. Vital Planet.

STATUTORY DECLARATION

Evidence (Miscellaneous Provisions) Act 1958, VIC,

I, Paul John Adams of 321 Ferntree Gully Road, Mt Waverley 3149 in the State of Victoria, do solemnly and sincerely declare that:

1 I am an officer, for the purposes of the *National Electricity (Victoria) Law* (**NEL**), of Jemena Electricity Networks (Vic) Limited ABN 82 064 651 083 (**JEN**), a regulated network service provider for the purposes of section 28D of the NEL.

2. The response of JEN regarding the information required to be provided and to be prepared and maintained as specified in the Australian Energy Regulator's (**AER**) Regulatory Information Notice (**Notice**) dated 1 June 2012, with the exception of the information to be audited under paragraph 1.1 of Appendix E to this Notice, is to the best of my information, knowledge and belief:

   a) except where expressly stated otherwise in the response submitted by JEN, in accordance with the requirements of the Notice; and

   b) is true and an accurate reflection of JEN's internal records used in the normal course of business, and in all material respects can be relied upon by the AER to:

      i. monitor the compliance of JEN with the distribution determination that applies to it for the regulatory control period that commenced on 1 January 2011;

      ii. publish reports relating to the financial or operational performance of JEN; and

      iii. prepare for the making of the distribution determination that will apply to JEN for the regulatory control period commencing 1 January 2016,

   in respect of the distribution services provided by way of the electricity distribution network JEN operates in Victoria.

I acknowledge that this declaration is true and correct, and make it with the understanding and belief that a person who makes a false declaration is liable to the penalties of perjury.

Declared at MELBOURNE in the State of Victoria

this 28TH day of APRIL 2014
