

May 2026

Statement of reasons: Jemena’s Annual Pricing Proposal

The AER approves Jemena’s 2026–27 pricing proposal which contains tariffs that are due to commence on 1 July 2026. Jemena’s approved tariffs are set out on [our website](#).

Estimated network cost movements

We estimate the average network cost movements below for Jemena’s customers in 2026–27, compared to 2025–26.

	Flat-rate tariff	Time-of-use tariff
Residential	-\$8.56	-\$20.21
Small business	+\$0.30	-\$3.78

The network cost movements reflect an increase in revenue that Jemena is allowed to recover in 2026–27. This is offset by a forecast increase in consumption. We provide more detailed information on Jemena’s consumption forecasts below.

The increase in revenue is predominantly due to increased transmission costs and actual inflation. This is partially offset by the return of previously over-recovered revenue. These key drivers can be seen in Figures 1 through 4.¹

Figure 1 Residential flat-rate tariff: Average annual network cost movement

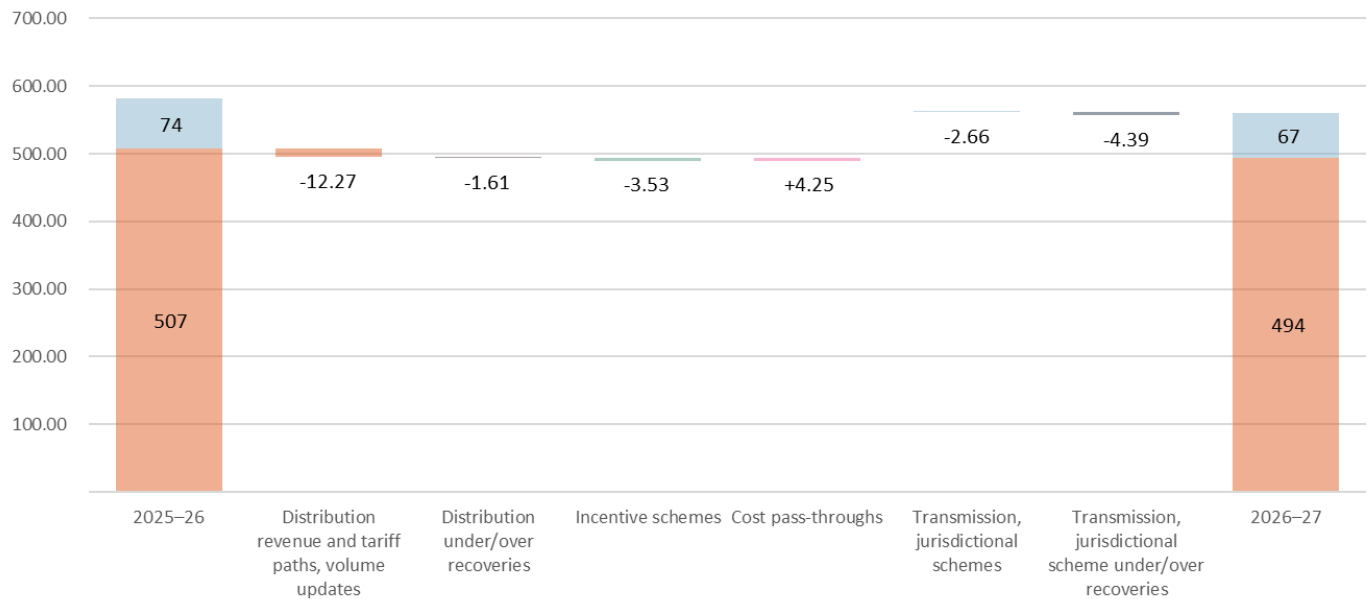

Source: AER analysis; Jemena’s 2026–27 pricing proposal.

Note: The above analysis assumes electricity usage of 4,372 kWh. This is based on the most recent data for electricity usage and customer numbers reported in Jemena’s 2026–27 pricing proposal for the Residential – Single Rate tariff.

¹ The columns in the charts represent the average annual network charge for relevant years. Within the columns, the orange columns represent the distribution and metering components of the approved network tariffs, including the impact of actual inflation. The blue columns represent revenues recovered on behalf of transmission networks and amounts related to schemes imposed by State or Territory Governments. The direction and magnitude of movements in these charts may differ to the listed revenue drivers and across the charts, reflecting distributors’ differing application of these revenue drivers across tariffs.

Figure 2 Residential time-of-use tariff: Average annual network cost movement

Source: AER analysis; Jemena's 2026-27 pricing proposal.

Note: The above analysis assumes annual electricity usage of 1,396 kWh in the peak period, 2,504 kWh in the off-peak period, and 777 kWh in the solar period. This is based on the most recent data for electricity usage and customer numbers reported in Jemena's 2026-27 pricing proposal for the Residential – Time of Use Daytime Saver tariff.

Figure 3 Small business flat-rate tariff: Average annual network cost movement

Source: AER analysis; Jemena's 2026-27 pricing proposal.

Note: The above analysis assumes annual electricity usage of 12,381 kWh. This is based on the most recent data for electricity usage and customer numbers reported in Jemena's 2026-27 pricing proposal for the Small Business – Single Rate tariff.

Figure 4 Small business time-of-use tariff: Average annual network cost movement

Source: AER analysis; Jemena's 2026-27 pricing proposal.

Note: The above analysis assumes annual electricity usage of 12,067 kWh in the peak period and 13,570 kWh in the off-peak period. This is based on the most recent data for electricity usage and customer numbers reported in Jemena's 2026-27 pricing proposal for the Small Business – TOU (time-of-use) Weekdays tariff.

Actual bill impacts for individual customers will vary from our estimates as customers may be on different tariffs or consume different amounts of energy from our assumptions. Our analysis is based on flat rate or block tariffs and the main time-of-use tariffs, which are generally the most common tariffs for residential and small business customers across the NEM. Distributors may apply movements from revenue drivers differently across tariffs, which may mean some tariffs increase while others decrease.

We note electricity retailers ultimately determine how these underlying network tariffs are reflected in the retail prices offered to customers. In most instances network charges make up less than half of the retail bill.

Under/over recovered revenues

Although we set the revenues the distributors can recover, the revenue they ultimately receive over an individual year is determined by the amount of actual energy consumed in that year. This is because:

- Actual energy consumption can fluctuate from forecast consumption because of a number of factors such as weather, increased uptake of solar PV, or the rate of electrification (that is, the shift from gas to electricity). These fluctuations in energy consumption result in distributors recovering more or less than the allowable revenue we set.
- Variations can also occur for the transmission costs and jurisdictional scheme amounts a distributor passes through to customers where actual payments differ to what was forecast.

To 'true-up' these variations in revenue, adjustments are made to allowable revenues for the upcoming financial year to ensure that over time, a distributor only recovers the revenue it is allowed.

Consumption forecasts

Electricity distributors operate under a revenue cap which sets the annual allowed revenue they can recover to deliver safe and reliable electricity within their networks. Prices are determined based on forecast consumption for that year, allowing distributors to recover their allowed revenue. If distributors forecast lower consumption, then other things being equal, prices are expected to be higher to allow them to recover the revenue allowed.

Our assessment of the distributors’ consumption forecasts includes analysis of historical consumption trends and the reasons put forward for any departure from them. This includes changes in post-pandemic consumption behaviour due to electrification, increases in distributed energy resources and ongoing data centre rollout across some jurisdictions.

Figure 5 shows that Jemena has forecast a large increase in energy consumption for 2026–27, driven by new data centre connections and increased operations at existing facilities. This is partially moderated by increased uptake of solar generation among large business customers.

Figure 5 Energy volumes (GWh)

Source: AER analysis; RIN and AIO data; Jemena’s 2026–27 pricing proposal.

Note: Victorian distribution networks have recently moved from calendar years to financial years. This included an additional 6-month period in the first half of 2021. We have annualised quantities for this period to be comparable with other years.

We consider Jemena’s consumption forecasts are reasonable based on our analysis and the supporting information provided by Jemena.
