1 Nature and Authority

1.1 Introduction

This guideline establishes a set of common definitions of reliability measures that can be used to assess and compare the reliability performance of Distribution Network Service Providers (DNSPs) for all jurisdictions in Australia.

Currently the Australian Energy Regulator (AER) and States regulators define how reliability should be measured, which means it is difficult to compare the reliability performance across Australia. Consequently, the Australian Energy Market Commission (AEMC) implemented a rule change that required us to develop common definitions for distribution reliability measures for application in the National Electricity Market (NEM).

1.2 Authority

Clause 6.28 of the National Electricity Rules (NER) requires the AER to make and publish, in accordance with the distribution consultation procedures, this Distribution Reliability Measures Guideline (the guideline).

1.3 Definitions and interpretation

In this guideline the words and phrases have the meaning given to them in:

- in section 3.2
- the glossary, or
- if not defined in the glossary, the NER or the National Energy Retail Rules (NERR).

1.4 Process for revision

We may amend or replace this guideline from time to time in accordance with the distribution consultation procedures.

The AER must review this guideline at least every 5 years.¹

1.5 Version history and effective date

A version number and an effective date of issue will identify every version of this guideline.

¹ NER clause 6.28(c)
2 Application of this guideline

We will apply the definitions of reliability measures specified in this guideline when we issue a Regulatory Information Notice (RIN) under section 28D or Regulatory information Order (ARIO) under section 28C of the National Electricity Law (NEL).

We may also make references to this guideline where we consider it appropriate to do so. Other regulatory bodies may make references to this guideline.
3 Reliability measures and supporting definitions

The reliability measures contained in this *guideline* are:

- SAIDI or System Average Interruption Duration Index
- SAIFI or System Average Interruption Frequency Index
- CAIDI or Customer Average Interruption Duration Index
- MAIFI or Momentary Average Interruption Frequency Index
- MAIFIe or Momentary Average Interruption Frequency Index event
- Supply reliability levels experienced by the lowest-reliability customers.

When calculating SAIDI, SAIFI, MAIFI and MAIFIe:

- Exclusions – One or more of the circumstances numbered 1 to 7 below in section 3.3 Exclusions may be excluded from the calculation of these reliability measures.

The MAIFI measure may be used where the current recording facilities do not have the capacity to record *momentary interruption events* under the MAIFIe method.

Reliability measures should be reported as planned and unplanned supply outages and total outages and on the following basis:

- by feeder type
- overall performance of the entire network.

The tables below provides the definitions of these measures to enable an assessment and comparison of reliability performance of DNSPs.
3.1 Measurements - CAIDI, SAIDI, SAIFI, MAIFI, MAIFle

CAIDI or Customer Average Interruption Duration Index in respect of a relevant period, means the total duration of all the Sustained Interruptions (in minutes) divided by the total number of Sustained Interruptions that have occurred during the relevant period, which is equivalent to dividing the SAIDI by the SAIFI measures.

This measure represents the average time to restore supply to customers after a supply interruption event.

This performance measure should be reported on both by feeder type and by distribution network overall basis.

SAIDI or System Average Interruption Duration Index, means the sum of the durations of all the Sustained Interruptions (in minutes), divided by the Customer Base. Momentary Interruptions (of three minutes or less) are excluded from the calculation of unplanned SAIDI.

SAIFI or System Average Interruption Frequency Index, means the total number of Sustained Interruptions, divided by the Customer Base. Momentary Interruptions (of three minutes or less) are excluded from the calculation of unplanned SAIFI.

MAIFI or Momentary Average Interruption Frequency Index, means the total number of Momentary Interruptions, divided by the Customer Base, provided that Momentary Interruptions that occur within the first three minutes of a Sustained Interruption are excluded from the calculation.

MAIFle or Momentary Average Interruption Frequency Index event, means the total number of Momentary Interruption Events divided by the Customer Base for the relevant period, provided that Momentary Interruptions that occur within the first three minutes of a Sustained Interruption are excluded from the calculation.

Notes: When calculating SAIDI, SAIFI, MAIFI and MAIFle:
- Exclusions – One or more of the circumstances numbered 1 to 7 in Section 3.3 of this section may be excluded from such calculations.
- Interruptions – The Interruptions used to calculate such measurements may be limited to Planned Interruptions or Unplanned Interruptions.
- Feeders – The calculations may be limited to CBD feeders, urban feeders, short rural feeders, long rural feeders or a combination of such feeders.

3.2 Definitions

CBD feeder means a feeder in the CBD area of State or Territory capital that has been determined by the relevant participating jurisdiction as supplying electricity to predominantly commercial, high-rise buildings, supplied by a predominantly underground distribution network containing significant interconnection and redundancy when compared to urban areas.

Customer means an end user of electricity who purchases electricity supplied through a distribution system to a connection point.

Customer Base in respect of a relevant period, means:
- the number of Distribution Customers as at the start of the relevant period; plus
- the number of Distribution Customers as at the end of the relevant period, divided by two.

Distribution Customer means a connection point between a distribution network and Customer that has been assigned a National Metering Identifier, including energised and de-energised connection points but excluding unmetered connection points without a National Metering Identifier.

Feeder means a power line, including underground cables, that is part of a distribution network.

**Interruption** means any loss of electricity supply to *Distribution Customers* associated with an *outage* of any part of the network, including *outages* affecting a single *Customer’s* premises but excluding *disconnections* caused by a *retailer* or a fault in electrical equipment owned by a *Customer*, provided that:

- the start of an *Interruption* is taken to be when the *Interruption* is initially automatically recorded by equipment such as *SCADA* or, where such equipment does not exist, at the time of the first *Customer* reports that there has been an *outage* in the *network*; and
- the end of an *Interruption* is taken to be when the *Interruption* is automatically recorded as ending by equipment such as *SCADA* or, where such equipment does not exist, the time when electricity supply is restored to the affected *Distribution Customers*.  

**Long rural feeder** means a *feeder* that is not a *CBD feeder*, *urban feeder* or *short rural feeder*.

**Major Event Day** has a meaning consistent with that given in the *IEEE Guide*, provided that for the purposes of applying a common distribution reliability measure, the regulator applies a log standard deviation of 2.5, that is, a ‘2.5 beta’.

**Momentary Interruption** means an *Interruption* to a *Distribution Customer’s* electricity supply with a duration of 3 minutes or less, provided that the end of each *Momentary Interruption* is taken to be when electricity supply is restored for any duration. (see Figure 1.2).

**Momentary Interruption Event** means one or more *Momentary Interruptions* that occur within a continued duration of 3 minute or less, provided that the successful restoration of electricity supply after any number of *Momentary Interruptions* is taken to be the end of the *Momentary Interruption Event*. (see Figure 1.2)

**National electricity legislation** has the meaning given in the *National Electricity Law*.

**Outage** means the loss of ability of a component to deliver electrical power.

Note: for reporting purposes:

- Single premises outage is a network interruption irrespective of whether the outage is caused by the customer’s installation. However, if power is still available at the point of supply, there is no supply interruption.
- HV single phase outage – unless accurate means to determine the exact number of customers affected, report of 67% of all downstream customers for a single-phase HV outage on a three phase network. Report of 100% of customers for all other HV outages, for example; when there is a single HV phase outage on a two phase or single phase HV system.
- LV single phase outage – unless accurate means to determine the exact number of customers affected, report of 33% of all downstream customers for a single phase outage.

**Planned Interruption** means an *Interruption* resulting from a *Distribution Network Service Provider’s* intentional interruption of electricity supply to a *Customer’s* premises where the *Customer* has been provided with prior notification of the *Interruption* in accordance with all applicable laws, rules and regulations.

**Point of Supply** has the same meaning as defined in the relevant jurisdiction’s *Service and Installation Rules*.

**SCADA** or *Supervisory Control and Data Acquisition* means a system employed to gather and analyse real-time data in respect of network related infrastructure.

**Short rural feeder** means a feeder with a total feeder route length less than 200 km, which is not a *CBD feeder* or *urban feeder*.

**Sustained Interruption** means an *Interruption* to a *Distribution Customer’s* electricity supply at the *point of supply* that has a duration longer than 3 minutes, provided that the successful restoration of supply to the *Distribution Customer* is taken to be the end of the *Sustained Interruption*.

---

2 The definition of interruption under this guideline is modified from that specified in the *National Electricity Retail Rules* because supply outages due to some upstream events are included in the reliability measures in addition to those interruptions initiated from the distribution networks.

3 The number of affected Customers during an *Interruption* may need to be estimated.
**Unplanned Interruption** means an *Interruption* that is not a *Planned Interruption*.

**Urban feeder** is a *feeder* which is not a *CBD feeder* and has a 3-year average maximum demand over the 3 year average feeder route length greater than 0.3 MVA/km.

**Inadequate level of service customer** means a *customer* experiencing greater than 4 times the Network average for unplanned SAIDI on a three-year rolling average basis compared with a network average customer.

Note DNSPs must report to the AER:
- the average unplanned SAIDI of the **inadequate level of service customer**
- the average unplanned SAIFI of the **inadequate level of service customer**
- the top five feeders or feeder sections with the most **inadequate level of service customer**
- the number of **inadequate level of service customer** of each of the top five feeders or feeder sections.

Where data are unavailable at feeder or feeder-section level, the DNSP may report on zone substation level.

### 3.3 Exclusions

Interruptions that result from the following circumstances may be excluded from the calculation of SAIDI, SAIFI, MAIFI and MAIFI:

1. **Load shedding** due to a generation shortfall.
2. Automatic **load shedding** due to the operation of under-frequency relays following the occurrence of a power system under-frequency condition.
3. **Load shedding** at the direction of AEMO or a System Operator.
4. **Load interruptions** caused by a failure of the shared transmission network.
5. **Load interruptions** caused by a failure of transmission connection assets except where the interruptions were due to (a) actions, or inactions, of the Distribution Network Service Provider that are inconsistent with good industry practice; or (b) inadequate planning of transmission network connection points and the Distribution Network Service Provider is responsible for the planning of transmission network connection points.

For example, when a DNSP omits to suppress back-up earth fault (BUEF) protection when undertaking network switching operation that resulted in momentary paralleling of supplies from two different terminal stations, which is inconsistent with the standard practice.

6. **Load interruptions** caused by the exercise of any obligation, right or discretion imposed upon or provided for under jurisdictional electricity legislation or national electricity legislation applying to a Distribution Network Service Provider.
7. **Load interruptions** caused or extended by a direction from state or federal emergency services, provided that a fault in, or the operation of, the network did not cause, in whole or part, the event giving rise to the direction.
8. **Load interruptions** caused or extended by a direction from state or federal emergency services, provided that a fault in, or the operation of, the network did not cause, in whole or part, the event giving rise to the direction.

**Interruptions** may also be excluded that occur on days where the daily unplanned SAIDI for the DNSP’s distribution network exceeds the **major event day** boundary, when the event has not been excluded under the seven exclusion clauses described above.
3.4 Illustration of how to measure supply interruptions

Figure 1.1 shows an example of a sustained interruption, where two unsuccessful attempts are made. In this case, the duration of the interruption is greater than the momentary interruption threshold of 3 minutes.

Figure 1.1 Sustained interruption, unsuccessful auto-reclose

Supply restored

Figure 1.2 demonstrates the difference between MAIFI and MAIFIe. It shows an example of a momentary interruption event, where the affected customers experience two momentary interruptions before the supply is successfully restored. In this case, the duration of the interruption is less than the momentary interruption threshold of 3 minutes.

Figure 1.2 Momentary interruption event

Supply restored within 3 minutes

- 1 count of MAIFIe
- 2 counts of MAIFI
- 0 count of SAIFI
- 0 minute of SAIDI
