## **Executive summary**

The Australian Energy Regulator (AER) works to make all Australian energy consumers better off, now and in the future. We regulate energy networks in all jurisdictions except Western Australia. This final decision sets out the amount of money United Energy can recover from electricity consumers for using its network over the 2021–26 regulatory control period.

United Energy owns and operates one of the five electricity distribution networks in Victoria and services around 660 000 customers from the east and south-east suburbs of Melbourne along the Mornington Peninsula. On 31 January 2020, United Energy submitted its proposal for the five year regulatory control period commencing 1 July 2021. And on 3 December 2020, submitted a revised proposal in response to our draft decision of 30 September 2020.

United Energy accepted many parts of our draft decision and demonstrated an ongoing commitment to consumer engagement in its revised proposal. United Energy's revised capital expenditure (capex) forecast although lower than its initial proposal, had addressed some of our draft decision concerns, but based on the information provided, was still too high to be an efficient and prudent total. In reaching our final decision we arrive at a prudent and efficient capex forecast, such that consumers pay no more than necessary. There were no material differences between United Energy's revised operating expenditure (opex) proposal and our draft decision, except it raised bushfire liability insurance cost increases as an important issue. We worked collaboratively to determine an efficient forecast insurance premium amount and have included it in the opex we approved.

We are satisfied that the amount of money we have allowed United Energy to recover from consumers is no more than necessary to replace ageing infrastructure and operate its network in a safe and reliable manner in the long term interest of consumers.

United Energy can recover \$2083.4 million (\$ nominal) from its consumers over the 2021–26 regulatory control period. In real terms, this is 7.9 per cent lower than the revenue allowed for in our 2016–20 final decision and leads to lower network charges for United Energy's consumers from the next regulatory control period. The revenue we allow forms the distribution network component of retail electricity bills, making up about 22 per cent of a standard residential bill (29 per cent for small businesses).

We estimate that United Energy's distribution network and metering charges in the first year of the 2021–26 regulatory control period will drop by \$60 (3.9 per cent) for residential consumers and \$267 (4.1 per cent) for small business consumers, relative to the charges in 2020. Thereafter, these charges are estimated stay relatively flat for the next four years of the 2021–26 regulatory control period.

Consumers have already seen changes from last years prices because new distribution network charges were passed through to Victorian consumers for six months on 1 January 2021 with the introduction of the *National Energy Legislation* 

*Amendment Act 2020* (Vic) (NELA Act).<sup>1</sup> In making this final decision we updated a range of components that were used to calculate the lower distribution network charges that were passed on to consumers on 1 January 2021. In particular, we updated the rate of return to reflect movements in interest rates and our revised estimate of expected inflation. As a result of these updates, distribution network charges starting from 1 July 2021 will be 2.4 per cent higher than the distribution network charges that were in place in 2020. We still need to consider other factors that will impact the final distribution network charge that consumers and business pay – these will be considered when we assess United Energy's annual pricing proposal.<sup>2</sup>

In making this final decision we have had regard to a range of sources including United Energy's revised proposal, submissions received, as well as analysis undertaken and published by us.

#### United Energy's engagement with consumers

A key development of the 2021–26 determination has been the positive shift by the distributors in relation to improved consumer engagement.

In recognition of this evolution, in our draft decision, we developed a framework<sup>3</sup> to assess the consumer engagement activities of the Victorian distributors. This framework informed how we viewed this engagement in relation to the initial expenditure proposals and our overall assessment. Stakeholder submissions provided positive support and feedback on this approach and we plan to undertake further stakeholder consultation on the future design of the framework following completion of the Victorian reset.

We recognise that consumer engagement can take many different approaches and in this final decision we have continued to refer to our stakeholder framework as outlined in the draft decision, which provides a benchmark for the discussion which is replicated at appendix C. We acknowledge that each distributor approached engagement differently and CitiPower, Powercor and United Energy worked together across the three networks to achieve their consumer engagement program. In developing their proposal, they sought to learn about their customer's values and preferences.<sup>4</sup>

<sup>&</sup>lt;sup>1</sup> The intention of the NELA was to change the timing of the regulatory control period for electricity distribution networks from a calendar year basis to a financial year basis, to align with other NEM states. We separately assessed the total allowed revenue for United Energy for the six month period from 1 January 2021 to 30 June 2021. See our final decision of 28 October 2020 at <u>https://www.aer.gov.au/networks-pipelines/determinationsaccess-arrangements/united-energy-determination-2021-26/aer-position#step-72923</u>.

<sup>&</sup>lt;sup>2</sup> See Pricing proposals & tariffs webpage on the AER's website: <u>https://www.aer.gov.au/networks-pipelines/determinations-access-arrangements/pricing-proposals-tariffs</u>.

<sup>&</sup>lt;sup>3</sup> AER, Draft decision, United Energy distribution determination 2021–26, Overview, September 2020, Table 7, p 42.

<sup>&</sup>lt;sup>4</sup> Through CitiPower, Powercor and United Energy's engagement program 'Energised 2021–26' they and engaged with 11 000 customers and stakeholders through around 2.5 million 'touch points'. See AER, *Draft Decision – United Energy distribution determination 2021–26 Overview*, September 2020, p. 4.

Our draft decision stated it was difficult to understand how consumer engagement learnings had influenced the initial proposals. We recognise that CitiPower, Powercor and United Energy have proactively responded to actively involve customers in the decision making process with the formation of their new Customer Advisory Panel (CAP). Ultimately, we maintained a bottom-up assessment of United Energy's capex, as we do not think sufficient customer engagement information was provided to persuade an alternative assessment. However, it does not prevent United Energy from spending from their aggregate capex on projects shown to be of value to its customers.

Consumer engagement models will continue to mature over time. Ongoing development of the framework will support businesses to develop proposals that are prudent and efficient, and demonstrate the express views and support of consumers.

#### Poles and asset management

Consistent with our previous decisions, we understand the importance of managing network risk and therefore allowed funding to distributors to address these risks.

In this case, United Energy has not provided sufficient evidence to justify a 50 per cent forecasted step up in wood poles replacement capital expenditure (repex) relative to its current period spend. In response to our draft decision, United Energy provided a comprehensive model to support its wood pole forecast. However, we do not think that this model and its inputs adequately support United Energy's wood poles forecast.

Given the lack of supporting evidence, we have maintained our draft decision to include \$53 million in the total capex allowance. We are satisfied that our substitute estimate which is in line with current regulatory control period spend will provide United Energy with sufficient funding to meet its capex objectives, including supporting safe and reliable provision of network services, under the National Electricity Rules (NER). This is because at current levels of historical capex it maintained low failures rates and performed well on other safety indicators.

## Ensuring consumers pay no more than necessary for safe and reliable services

Ensuring consumers pay no more than necessary for safe and reliable electricity is a cornerstone of the regulatory determination process. We must assess whether a business' proposal is a reasonable and realistic forecast of how much money it needs for the safe and reliable operation of the network. It also involves encouraging distributors to explore how they can provide better services at lower cost through a range of incentive schemes.

Our final decision approved most of United Energy's revised expenditure proposal, the main element we did not approve was capex.

We have not accepted United Energy's revised total forecast capex of \$944.6 million. Overall, it did not provide sufficient evidence that a step up of 17 per cent relative to its current period spend is required over the forecast period. We undertook a detailed bottom-up assessment of the capex categories where the top-down metrics indicated the forecast may not be prudent and efficient. Our detailed bottom-up review also helped inform our substitute estimate.

We do not consider total forecast capex proposed by United Energy reasonably reflects the capex criteria. We are satisfied that our substitute total capex forecast which is 4 per cent below United Energy's forecast, is sufficient for it to maintain the safety and reliability of its network. This is because our substitute capex forecast of \$902.7 million is 12 per cent higher than its current period spend. At its current period spend level, United Energy has performed well against a number of network health measures. For instance, it has one of the lowest pole failure rates in Victoria and the National Electricity Market (NEM), suggesting the current level of repex is adequate to maintain network safety and reliability. Our substitute estimate does not preclude United Energy spending more or less on capex in aggregate or for the component programs.

Our final decision accepts United Energy's updated revised total opex proposal of \$728.7 million (\$2020–21). This is because it is not materially different to our alternative opex estimate of \$722.8 million (\$2020–21). We acknowledge there is some uncertainty with future insurance premium forecasts, but believe businesses should be incentivised through our framework to achieve efficient outcomes and lower prices for consumers in subsequent periods by including these costs in the total opex forecast. United Energy provided a higher updated revised proposal with a step change of \$28.9 million (\$2020–21) for these future premium increases. We considered this was reasonable and have accepted it as a part of its total opex proposal. As a result we have not accepted the proposed insurance premium event nominated cost pass through for the 2021–26 regulatory control period.

Having reviewed an application by CitiPower, Powercor and United Energy, we determined that the annual payments made by the Victorian distributors to Energy Safe Victoria (ESV) is a jurisdictional scheme<sup>5</sup>. This final determination includes a decision on how United Energy is to report to the AER on its recovery of amounts for the scheme and on adjustments made in pricing proposals to account for over or under recovery. For all Victorian distributors it will be recovered through annual prices rather than the allowed (opex) revenue we set in our decision.

#### Transition of the energy system

Facilitating the transition of the energy system is a key theme for this Victorian regulatory determination process. Mechanisms such as expenditure to physically accommodate greater solar exports, tariff price and demand management initiatives can help. We consider the transition of the energy system so important that we have made incentivising networks to become platforms for energy services a strategic objective in our regulation of networks.

<sup>&</sup>lt;sup>5</sup> See <u>https://www.aer.gov.au/communication/aer-makes-determination-on-cpus-application-for-a-jurisdictional-scheme</u>.

United Energy accepted our draft decision on the amount of capex required to facilitate and integrate distributed energy resources (DER) on its network. Our decision supports United Energy accommodating solar PV growth on its networks to achieve consumer expectations regarding the Victorian Government's Solar Homes program.

We have engaged extensively with stakeholders in the development of consistent DER integration expenditure guidelines. We published CSIRO and CutlerMerz's final value of DER (VaDER) methodology study in November 2020. However, the Australian Energy Market Commission (AEMC) recently published draft rule changes which have implications for our DER integration expenditure guideline, and which will delay its finalisation.<sup>6</sup>

Cost reflective network tariffs also have an important part to play in the energy transition by incentivising the location and use of DER to optimise benefits to consumers and networks.

We are encouraged by the Victorian distributors' efforts to progress network tariff reform during the 2021–26 regulatory control period. The distributors moved from opt–in to opt–out assignment to the new default time of use tariff for consumers receiving a new meter or who upgrade their connection. By working collaboratively with their stakeholders<sup>7</sup> they developed small consumer tariff proposals with aligned, more targeted peak charging windows. We are also pleased to see the Victorian distributors reassigning small consumers on legacy cost reflective tariffs to new and more targeted default time of use tariff.

We engaged rigorously with the electric vehicle (EV) sector and heard many different perspectives. We encourage EV charging station and energy storage proponents to engage with the Victorian distributors on tariff trials. We see trials as a valuable way of proving out new and innovative service models to inform future network tariffs.

Our view is that it is important that EV charging stations face cost reflective network tariffs to minimise new network investment that increases costs for all consumers. Consistent with our view, charging stations which install load limiting devices can access alternative cost reflective tariffs. Our final decision also makes clear, consistent with Victorian Government policy, that once small consumers with an EV are identified they must be assigned to a cost reflective network tariff.

We consider storage assets should both contribute to recovery of network costs commensurate with their network use and see cost reflective price signals to guide their operation. Our final decision on stand-alone grid scale storage connected to the Victorian networks is to assign such consumers according to the usual tariff classes unless they are only providing network support services. Regardless, ownership of storage assets should not affect tariff class assignment.

<sup>&</sup>lt;sup>6</sup> See <u>https://www.aemc.gov.au/rule-changes/access-pricing-and-incentive-arrangements-distributed-energy-resources</u>.

<sup>&</sup>lt;sup>7</sup> Which included retailers and jurisdictional government entities.

## Note

This attachment forms part of the AER's final decision on the distribution determination that will apply to United Energy for the 2021–26 regulatory control period. It should be read with all other parts of the final decision.

The final decision includes the following attachments:

Overview

- Attachment 1 Annual revenue requirement
- Attachment 2 Regulatory asset base
- Attachment 3 Rate of return
- Attachment 4 Regulatory depreciation
- Attachment 5 Capital expenditure
- Attachment 6 Operating expenditure
- Attachment 7 Corporate income tax
- Attachment 8 Efficiency benefit sharing scheme
- Attachment 9 Capital expenditure sharing scheme
- Attachment 10 Service target performance incentive scheme
- Attachment 12 Customer Service Incentive Scheme
- Attachment 13 Classification of services
- Attachment 14 Control mechanisms
- Attachment 15 Pass through events
- Attachment 16 Alternative control services
- Attachment 18 Connection policy
- Attachment 19 Tariff structure statement
- Attachment A Negotiating framework

## 1 Our final decision

Our final decision would allow United Energy to recover a total revenue of \$2083.4 million (\$ nominal) from its consumers from 1 July 2021 to 30 June 2026. United Energy is regulated using a revenue cap. Incentives are provided to it to reduce costs, improve service quality and undertake efficient investments.

Our final decision for United Energy determines the total revenue it can recover from consumers for the provision of common distribution services (standard control services (SCS)). This forms the basis of United Energy's distribution tariffs for the 2021–26 regulatory control period. United Energy's Tariff Structure Statement (TSS) sets out the tariff structure through which it will recover its regulated revenue for SCS from consumers.

United Energy also provides alternative control services (ACS), the costs of which are recovered only from users of those services. These costs are considered separately to our building block determination.<sup>8</sup> Our final decision sets out the prices United Energy is allowed to charge consumers for the provision of ACS: ancillary network services, public lighting and total revenue for metering. United Energy has not proposed to provide any services on a negotiated basis in the 2021–26 regulatory control period.<sup>9</sup>

We have taken United Energy's consumer engagement into account in developing our final decision. More information is provided at section 3.

#### 1.1 What's driving revenue?

Revenue is driven by changes in real costs and inflation. We assess costs (such as capital and operating expenditure) in real terms (using 2020–21 as a common year) to reveal the underlying cost trends over a number of years or regulatory control periods. The numbers presented in this overview are in real 2020–21 dollars unless otherwise noted. Some aspects of our decision are presented in nominal terms to be consistent with the NER and to enable consumers to see the full impact of our determination inclusive of expected inflation.

The total revenue allowance in this 2021–26 final decision is 7.9 per cent lower than the allowed revenue provided for in our 2016–20 final decision in real terms. Figure 1 shows real revenue decrease from 2020 levels by 14.7 per cent in the first year of the next regulatory control period. After that, United Energy's revenue allowance decreases by 1.5 per cent per year.

<sup>&</sup>lt;sup>8</sup> We discuss alternative control services in Attachment 16 to this draft decision.

<sup>&</sup>lt;sup>9</sup> Our distribution determination for United Energy includes an approved negotiating framework and negotiated distribution service criteria, as required by the NER. Because United Energy has not included any negotiated services in its proposal, these elements of our determination will be inactive for the 2021–26 regulatory control period.

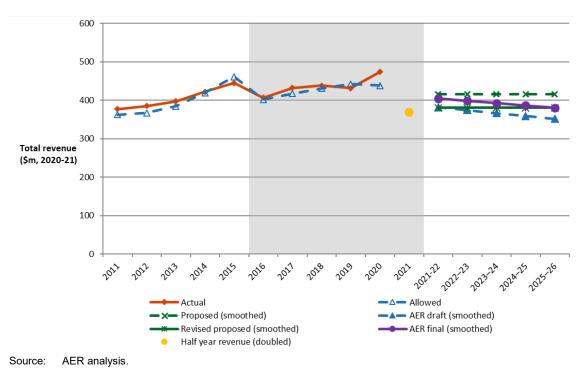

Figure 2 highlights the key drivers of the change in United Energy's allowed revenue from the 2016–20 regulatory control period compared to what we expect in the 2021–26 regulatory control period. It illustrates that the largest driver of change is the return on capital building block. The rate of return has decreased from around 6.37 per cent in the 2016–20 regulatory control period to 4.76 per cent for the 2021–26 period. As a result, the total cost of capital had reduced by \$213.0 million.<sup>10</sup> In 2019, we reviewed how we calculate the cost of corporate tax and made changes to our approach to align with the latest rulings of the Australian Tax Office. This means we expect the tax allowance for United Energy will be lower than it was in the past. As a result, Figure 2 also shows a decrease in the cost of corporate tax building block of \$92.6 million.<sup>11</sup> Other changes include:

- Increase to forecast regulatory depreciation by 29.8 per cent. Each year, United Energy builds new equipment to keep its network running. The cost of this new equipment is added to a cumulative total called the regulatory asset base or RAB. Over time, the cost of this equipment is paid back to United Energy through depreciation. Because United Energy added new equipment to its network over the last five years, its RAB is increasing and so is its depreciation. United Energy's increase in depreciation is also affected by lower expected inflation over the 2021– 26 regulatory control period.<sup>12</sup>
- Increase to revenue adjustments of \$82.6 million. This is mainly driven by the application of capital expenditure sharing scheme (CESS).

<sup>&</sup>lt;sup>10</sup> The rate of return is a nominal rate of return unless stated otherwise. The real rate of return has decreased by a similar amount. Please see section 2.2 for further details.

<sup>&</sup>lt;sup>11</sup> Please see section 2.6 for further details.

<sup>&</sup>lt;sup>12</sup> Please see section 2.3 for further details.

 Reduction to forecast opex compared to the 2016–20 regulatory control period, by 8.6 per cent.<sup>13</sup>

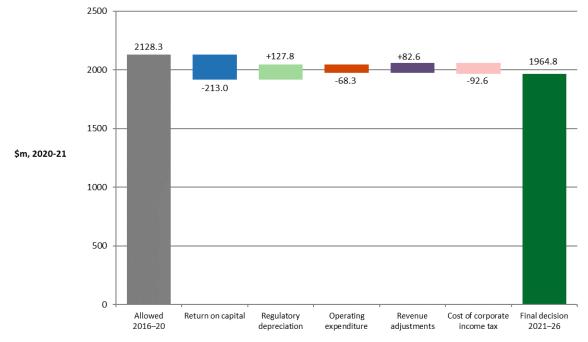

Figure 2 Change in revenue from 2016–20 to 2021–26 (\$ million, 2020–21)

Source: AER analysis.

Figure 3 compares our final decision forecast RAB to United Energy's revised proposed and actual RAB. This shows that United Energy's RAB is forecast to increase by around 4.7 per cent in value over the 2021–26 regulatory control period, compared to a 3.9 per cent increase in the current 2016–20 regulatory control period.<sup>14</sup> This difference is mainly driven by higher forecast capex for the 2021–26 regulatory control period compared to capex incurred (and estimated) in the 2016–20 regulatory control period, which is then partially offset by an increase in regulatory depreciation.

<sup>&</sup>lt;sup>13</sup> Please see section 2.5 for further details. This comparison is based on converting 2016–20 forecast opex for inflation to 2020–21 dollar terms using lagged CPI.

<sup>&</sup>lt;sup>14</sup> Please see section 2.1 for further details.

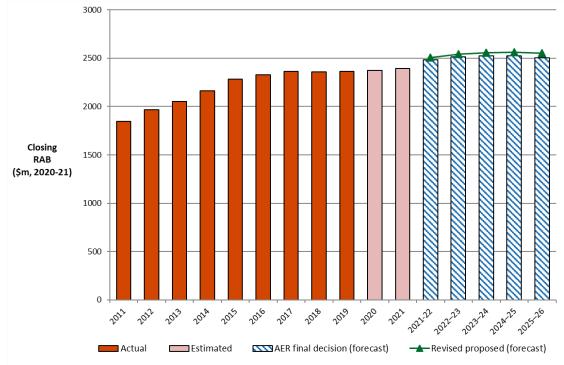

Figure 3 Value of United Energy's RAB over time (\$ million, 2020-21)

Source: AER analysis.

# 1.2 Differences between revised proposal and final decision

Our final decision has determined total revenues of \$2083.4 million (\$ nominal) for the 2021–26 regulatory control period. This is \$39.6 million or 1.9 per cent higher than United Energy's revised proposal of \$2043.8 million.

We have largely accepted United Energy's revenue proposal and the difference is due to us updating the proposed building block amounts using more recent information.

The biggest contributor to the difference between our final decision revenue and United Energy's proposal is regulatory depreciation. Our estimate of the regulatory depreciation of \$592.7 million is \$31.7 million (\$ nominal) or 5.7 per cent higher than United Energy's revised proposal estimate of \$561.0 million (\$ nominal). The main driver of this difference is the lower expected inflation which resulted from our inflation review. Our latest version of the post-tax revenue model (PTRM) (version 5) released in April 2021 amended the way we estimate inflation, in order to improve our estimation in periods of economic instability or sustained periods of low or high inflation.<sup>15</sup> Our final decision estimates expected inflation of 2.00 per cent, lower than United Energy's estimate of expected inflation of 2.37 per cent.

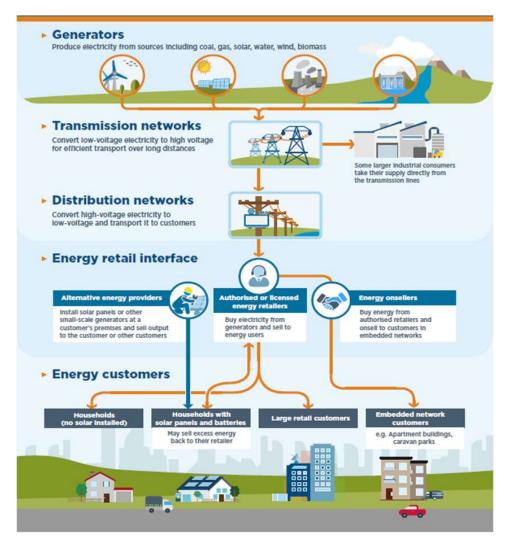

Based on evidence before us, we are not satisfied that United Energy's revised proposed forecast capex of \$944.6 million (\$2020–21) reasonably reflect prudent and efficient costs. Our substitute capex forecast is \$42.0 million (\$2020–21) or

<sup>&</sup>lt;sup>15</sup> AER, *Final position paper - Regulatory treatment of inflation*, December 2020, p. 6.

4.4 per cent lower than the revised proposal. This leads to a lower forecast RAB than United Energy's proposal. The lower forecast RAB also contributes to our lower final decision revenues through a lower return of capital and regulatory depreciation allowance.

# 1.3 Expected impact of our final decision on electricity bills

United Energy's distribution network SCS charges make up around 22 per cent of the total residential bill and 29 per cent of the total small business retail electricity bill. Our decision also covers charges for revenue-capped metering services (that form part of ACS) and these costs are included in this estimated bill impact analysis. Other components of the electricity bill include wholesale electricity costs, retail costs and environmental policy costs. Figure 4 illustrates the different components of the electricity supply chain. Each of these costs contributes to the retail prices charged to customers by their chosen electricity retailer.

#### Figure 4 Electricity supply chain

Source: AER, State of the Energy Market, December 2018, p. 28.

For this final decision, we have estimated some indicative average distribution price impacts flowing from our allowed revenue determination. These prices are indicative and might vary with changes in demand. Table 1 shows the estimated average annual impact of our final decision for the 2021–26 regulatory control period on electricity bills for residential and small business customers.

We estimate the expected impact on bills by varying the distribution charges in line with our 2021–26 final decision, while holding all other components constant. This approach isolates the effect of our final decision on distribution network tariffs from other parts of the bill. However, this does not mean that other components will remain unchanged across the regulatory control period.<sup>16</sup>

Under the final decision we estimate that compared to 2020 charges, the distribution network and metering charges (\$ nominal) in United Energy's area:

- for an average residential consumer would:
  - reduce by \$60 (3.9 per cent) in the first year of the 2021–26 regulatory control period
  - stay relatively flat for each of the remaining four years of the 2021–26 regulatory control period.
- for an average small business consumer would:
  - reduce by \$267 (4.1 per cent) in the first year of the 2021–26 regulatory control period
  - stay relatively flat for each of the remaining four years of the 2021–26 regulatory control period.

<sup>&</sup>lt;sup>16</sup> It also assumes that actual energy consumption will equal the forecast adopted in our final decision. Since United Energy operates under a revenue cap, changes in energy consumption will also affect annual electricity bills across the 2021–26 regulatory control period.

# Table 1 Estimated contribution to annual electricity bills for the 2021–26regulatory control period (\$ nominal)

Source: AER analysis; Essential Services Commission, Victorian Default Offer to apply from 1 January 2020 – Final decision, 18 November 2019, p. 76.

- (a) Annual bill for 2020 is sourced from Essential Services Commission, Victorian Default Offer to apply from 1 January 2020 – Final decision and reflects the average consumption of 4000 kWh for residential customers in Victoria. This is then indexed by CPI for the half year period from 1 January 2021 to 30 June 2021 to allow comparison of the bill impact from 1 July 2021 onwards.
- (b) Annual bill for 2020 is sourced from Essential Services Commission, Victorian Default Offer to apply from 1 January 2020 – Final decision and reflects the average consumption of 20000 kWh for small business customers in Victoria. This is then indexed by Consumer Price Index (CPI) for the half year period from 1 January 2021 to 30 June 2021 to allow comparison of the bill impact from 1 July 2021 onwards.
- (c) Annual change amounts and percentages are indicative. They are derived by varying the distribution component of the 2020 bill amounts in proportion to yearly expected revenue divided by forecast energy as provided by United Energy. Actual bill impacts will vary depending on electricity consumption and tariff class.

# 2 Key components of our final decision on revenue

The total revenue United Energy proposed reflects its forecast of the efficient cost of providing network services over the 2021–26 regulatory control period. United Energy's proposal, and our assessment of it under the National Electricity Law (NEL) and NER, are based on a 'building block' approach to determining a total revenue allowance (see Figure 5) which looks at six cost components:

- a return on the RAB (or return on capital, to compensate investors for the opportunity cost of funds invested in this business) (section 2.2)
- depreciation of the RAB (or return of capital, to return the initial investment to investors over time) (section 2.3)
- capex the capital expenditure incurred in the provision of network services mostly relates to assets with long lives, the cost of which are recovered over several regulatory control periods. The forecast capex approved in our decisions directly affects the projected size of the RAB and therefore the revenue generated from the return on capital and depreciation building blocks (section 2.4)
- opex the operating, maintenance and other non-capital expenses incurred in the provision of network services (section 2.5)
- the estimated cost of corporate income tax (section 2.6)
- revenue adjustments, including revenue increments or decrements resulting from the application of incentive schemes, such as the efficiency benefit sharing scheme (EBSS) and CESS that applied to United Energy for the 2016–20 regulatory control period and the Demand Management Innovation Allowance Mechanism (DMIAM) allowance for 2021–26 (section 2.7).

#### Figure 5 The building block model to forecast network revenue

Source: AER, State of the Energy Market, December 2018, p.138.

We use an incentive approach where, once regulated revenues are set for a five year period. Networks who keep actual costs below the regulatory forecast of costs retain

part of the benefit. This incentive framework is a foundation of the regulatory framework, and is consistent with the National Electricity Objective (NEO). Service providers have an incentive to become more efficient over time, as they retain part of the financial benefit from improved efficiency. Consumers also benefit when efficient costs are revealed and a lower cost benchmark is set in subsequent regulatory periods.

Our final decision on United Energy's distribution revenues for the 2021–26 regulatory control period is set out in Table 2.

Table 2	AER's final decision on United Energy's revenues for the
2021–26	regulatory control period (\$ million, nominal)

	2021–22	2022–23	2023–24	2024–25	2025–26	Total
Return on capital	113.9	115.7	114.4	111.8	108.8	564.6
Regulatory depreciation <sup>a</sup>	92.2	109.6	120.3	130.3	140.3	592.7
Operating expenditure <sup>b</sup>	146.1	148.6	154.4	159.6	165.4	774.0
Revenue adjustments <sup>c</sup>	39.7	43.3	25.1	10.6	12.0	130.7
Cost of corporate income tax	3.7	3.4	3.3	6.3	7.1	23.7
Annual revenue requirement (unsmoothed)	395.6	420.5	417.5	418.5	433.6	2085.7
Annual expected revenue (smoothed)	412.8	414.7	416.7	418.6	420.6	2083.4
X factor <sup>d</sup>	n/aª	1.50%	1.50%	1.50%	1.50%	n/a

Source: AER analysis.

- (a) Regulatory depreciation is straight-line depreciation net of the inflation indexation on the opening regulatory asset base (RAB).
- (b) Includes debt raising costs.
- (c) Includes revenue adjustments from the efficiency benefit sharing scheme (EBSS), the capital expenditure sharing scheme (CESS), shared assets adjustments and the demand management innovation allowance mechanism (DMIAM).
- (d) The X factors will be revised to reflect the annual return on debt update. Under the CPI–X framework, the X factor measures the real rate of change in annual expected revenue from one year to the next. A negative X factor represents a real increase in revenue. Conversely, a positive X factor represents a real decrease in revenue.
- (e) United Energy is not required to apply an X factor for 2021–22 because we set the 2021–22 expected revenue in this decision. The expected revenue for 2021–22 is around 14.7 per cent lower than the approved total annual revenue for 2020 in real terms, or 13.0 per cent lower in nominal terms after taking into account the escalation by half year Consumer Price Index (CPI) to allow comparison of the revenue from 1 July 2021 onwards.

### 2.1 Regulatory asset base

The RAB is the value of assets used by United Energy to provide regulated distribution services. The value of the RAB substantially impacts United Energy's revenue requirement, and the price consumers ultimately pay. This makes it a key issue for many stakeholders. Other things being equal, a higher RAB would increase both the return on capital and depreciation (return of capital) components of the revenue determination.

As part of our decision on United Energy's revenue for 2021–26, we make a decision on United Energy's opening RAB as at 1 July 2021. We use the RAB at the start of each regulatory year to determine the return of capital (regulatory depreciation) and return on capital building block.

Our final decision is to determine an opening RAB value of \$2392.9 million (\$nominal) as at 1 July 2021 for United Energy. This amount is \$17.8 million (or 0.7 per cent) lower than United Energy's revised proposed opening RAB of \$2410.7 million (\$nominal) as at 1 July 2021.<sup>17</sup> While we largely accept the proposed methodology for calculating the opening RAB, we made the following revisions to United Energy's proposed inputs to the roll forward model (RFM):

- Amended the 2020 capex estimate, which was provided by United Energy subsequent to the revised proposal.
- Amended inputs for the six month period of 1 January to 30 June 2021 (the six month 2021 period) for the nominal rate of return and equity raising costs.

To determine the opening RAB as at 1 July 2021, we have rolled forward the RAB over the 2016–20 regulatory control period and a further roll forward for the six month 2021 period<sup>18</sup> to arrive at a closing RAB value at 30 June 2021 in accordance with our RFM. This roll forward includes an adjustment at the end of the 2016–20 regulatory control period to account for the difference between actual 2015 capex and the estimate approved in the 2016–20 determination.<sup>19</sup> All other end of period adjustments are applied at 30 June 2021 to establish the opening RAB value at 1 July 2021.<sup>20</sup> Table 3 sets out the roll forward of the RAB to the end of the 2016–21 period.

# Table 3 AER's final decision on United Energy's RAB for 2016–21 period(\$ million, nominal)

	2016	2017	2018	2019	2020ª	<b>2021</b> ⁵
Opening RAB	2083.0	2153.1	2207.3	2249.1	2298.5	2345.1
Capital expenditure <sup>c</sup>	175.6	153.1	132.1	143.9	167.4	87.2
Inflation indexation on opening RAB	31.5	22.0	42.7	46.7	36.6	28.6
Less: straight-line depreciation <sup>d</sup>	137.1	120.9	132.9	141.2	146.0	68.0
Interim closing RAB	2153.1	2207.3	2249.1	2298.5	2356.6	2392.9
Difference between estimated and actual capex in 2015					-8.9	
Return on difference for 2015 capex					-2.7	

<sup>17</sup> United Energy, *Revised regulatory proposal 2021–26*, December 2020, p. 50.

- <sup>18</sup> The additional roll forward for six months is due to the decision by the Victorian government to change the timing of the annual Victorian electricity network price changes to financial year basis from calendar year basis. This change means the current regulatory control period of 2016–20 is extended by six months and the next regulatory control period will commence on 1 July 2021.
- <sup>19</sup> The adjustment will be positive (negative) if actual capex is higher (lower) than the estimate approved at the 2016– 20 determination.
- <sup>20</sup> These end of period adjustments are applied at the end of the final year of the roll forward period which in this case is 30 June 2021. For United Energy this includes reallocation for accelerated depreciation purposes associated with solar enablement distribution transformers.

	2016	2017	2018	2019	2020ª	<b>2021</b> ⁵
Closing RAB as at 31 December 2020					2345.1	
Opening RAB as at 1 July 2021						2392.9
Source: AER analysis.						

- (a) Based on estimated capex provided by United Energy. We will true-up the RAB for actual capex at the next reset.
- (b) The six month 2021 period of 1 January to 30 June 2021. Based on estimated capex provided by United Energy. We expect to update the RAB roll forward with a revised capex estimate in the final decision, and true-up the RAB for actual capex at the next reset.
- (c) Net of disposals and capital contributions, and adjusted for actual CPI and half-year WACC.
- (d) Adjusted for actual CPI. Based on forecast capex.

Note: Summation of entries may not equal totals due to rounding.

For this final decision, we determine a forecast closing RAB value at 30 June 2026 of \$2766.7 million (\$nominal) for United Energy. This is \$102.9 million (or 3.6 per cent) lower than United Energy's revised proposal of \$2869.6 million (\$nominal). Our final decision on the forecast closing RAB reflects the amended opening RAB as at 1 July 2021, and our final decisions on the expected inflation rate (attachment 3), forecast depreciation (attachment 4) and forecast capex (attachment 5).<sup>21</sup> Table 4 sets out our final decision on the forecast RAB values for United Energy over the 2021–26 regulatory control period.

# Table 4 AER's final decision on United Energy's RAB for the 2021–26regulatory control period (\$ million, nominal)

	2021–22	2022–23	2023–24	2024–25	2025–26
Opening RAB	2392.9	2533.2	2616.6	2676.3	2731.7
Capital expenditure <sup>a</sup>	232.5	193.1	180.0	185.6	175.4

Closing RAB	2533.2	2616.6	2676.3	2731.7	2766.7

Source: AER analysis.

(a) Net of forecast disposals and capital contributions. In accordance with the timing assumptions of the post-tax revenue model (PTRM), the capex includes a half-year WACC allowance to compensate for the six-month period before capex is added to the RAB for revenue modelling.

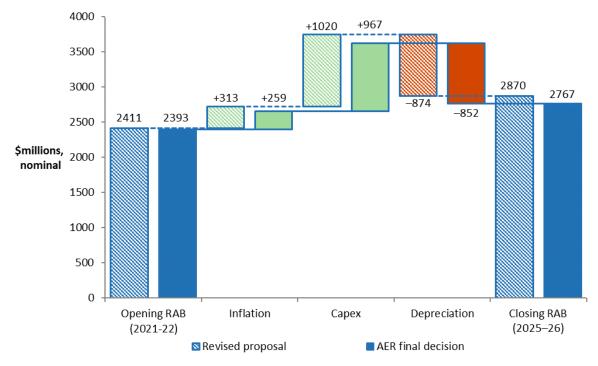

We are satisfied that the use of a forecast depreciation approach in combination with the application of the CESS and our other ex post capex measures are sufficient to

<sup>&</sup>lt;sup>21</sup> Capex enters the RAB net of forecast disposals. It includes equity raising costs (where relevant) and the half-year WACC to account for the timing assumptions in the PTRM. Therefore, our final decision on the forecast RAB also reflects our amendments to the rate of return for the 2021–26 regulatory control period (section 2.2 of the Overview).

achieve the capex incentive objective.<sup>22</sup> Further, this approach is consistent with our draft decision, United Energy's initial proposal and our *Framework and approach*.<sup>23</sup>

Figure 6 shows the key drivers of the change in United Energy's RAB over the 2021–26 regulatory control period for this final decision. Overall, the closing RAB at the end of the 2021–26 regulatory control period is forecast to be 15.6 per cent higher than the opening RAB at the start of that period, in nominal terms. The approved forecast net capex increases the RAB by 40.4 per cent, while expected inflation increases it by 10.8 per cent. Forecast depreciation, on the other hand, reduces the RAB by 35.6 per cent.

# Figure 6 United Energy's actual, revised proposed and AER final decision RAB (\$ million, nominal)

Source: AER analysis.

Note: Capex is net of forecast disposals and capital contributions. It is inclusive of the half-year WACC to account for the timing assumptions in the PTRM.

Further detail on our final decision regarding the RAB is set out in attachment 2.

### 2.2 Rate of return and value of imputation credits

The return each business is to receive on its RAB (the 'return on capital') is a key driver of proposed revenues. We calculate the regulated return on capital by applying a

<sup>&</sup>lt;sup>22</sup> Our ex post capex measures are set out in the capex incentive guideline, AER, *Capital expenditure incentive guideline for electricity network service providers*, November 2013, pp. 13–19 and 20–21. The guideline also sets out how all our capex incentive measures are consistent with the capex incentive objective.

<sup>&</sup>lt;sup>23</sup> AER, Draft decision: United Energy distribution determination 2021 to 2026, attachment 2 – Regulatory Asset Base, September 2020, p. 19; United Energy, UE Revised regulatory proposal 2021–26, 3 December 2020, pp. 54–55; AER, Final framework and approach for AusNet Services, CitiPower, Jemena, Powercor and United Energy – Regulatory control period commencing 1 January 2021, January 2019, pp. 83–85.

rate of return to the value of the RAB. We estimate the rate of return by combining the returns of the two sources of funds for investment: equity and debt.

The allowed rate of return provides the business with a return on capital to service the interest on its loans and give a return on equity to investors. An accurate estimate of the rate of return is necessary to promote efficient prices in the long-term interests of consumers. We are required by the NEL to apply a rate of return instrument—the current 2018 Rate of Return Instrument (2018 Instrument)—to estimate an allowed rate of return.<sup>24</sup>

The Victorian Government has moved the Victorian distributors from a calendar year regulatory control period to a financial year regulatory control period. <sup>25</sup>This entails a six month extension to the current regulatory control period (2016–20) through to June 2021 then a five year regulatory control period starting on 1 July 2021.<sup>26</sup> Our 2018 Instrument needs to be applied from 1 January 2021—that is, to the six month extension period as well as the following five financial years which form the 2021–26 regulatory control period. Some amendments to the 2018 Instrument were needed to accommodate the additional six month period. The Victorian government enabled these amendments through the NELA Act.<sup>27</sup> Therefore, we apply modified 2018 Instruments to both periods.<sup>28 29</sup>

Application of a modified 2018 Instrument in this final decision estimates an allowed rate of return of 4.76 per cent (nominal vanilla) for the five year regulatory control period commencing 1 July 2021. We note United Energy's proposal and revised proposal also accepted the application of these modifications to the 2018 Instrument.<sup>30</sup>

Our calculated rate of return (in Table 5) will apply to the first year of the 2021–26 regulatory control period. A different rate of return will apply for the remaining regulatory years of the period. This is because we will update the return on debt component of the rate of return each year in accordance with a modified 2018 Instrument, which uses a 10-year trailing average portfolio return on debt that is rolled-forward each year.

<sup>&</sup>lt;sup>24</sup> NEL, Part 3, division 1B. AER, *Rate of return instrument*, December 2018, available at <u>https://www.aer.gov.au/networks-pipelines/guidelinesschemes-models-reviews/rate-of-return-guideline-2018/final-decision</u>

<sup>&</sup>lt;sup>25</sup> National Energy Legislation Amendment Act 2020 (Vic).

<sup>&</sup>lt;sup>26</sup> The six month extension period was also labelled as the 'mini-year' when we consulted on the modifications to the 2018 Rate of Return Instrument.

Source: AER analysis; United Energy, 2021–2026 Revised regulatory proposal, 3 December 2020, p. 55; and United Energy, United Energy – Revised Regulatory Proposal - 2021–26 – MOD 10.02 – PTRM – March 2021.x/s, March 2021.

<sup>a,b</sup> Calculated using a placeholder averaging period.

<sup>c,</sup> Calculated using an averaging period of 2 January to 29 March 2021.

<sup>d</sup> Final decision return on debt is calculated using the proposed and accepted debt averaging period.

Our final decision is also to accept United Energy's proposed risk free rate averaging period<sup>31</sup> and debt averaging periods because they comply with conditions in a modified 2018 Instrument.<sup>32</sup> These were submitted with its initial regulatory proposal and we specify the debt averaging periods in confidential appendix A to attachment 3.

#### Debt and equity raising costs

In addition to providing for the required rate of return on debt and equity, we provide an allowance for the transaction costs associated with raising debt and equity. We include debt raising costs in the opex forecast because these are regular and ongoing costs. We include equity raising costs in the capex forecast because these costs are only incurred once and would be associated with funding the particular capital investments.

We note United Energy has proposed to use our approach to estimate equity raising costs.<sup>33</sup> We have updated our estimate for this regulatory control period based on the

<sup>&</sup>lt;sup>31</sup> This is also known as the return on equity averaging period.

<sup>&</sup>lt;sup>32</sup> For the financial year regulatory control period instrument, see the Order in Council made on 27 October 2020 under section 16VE of the NEVA (*Attachment A - Modified rate of return instrument for the regulatory control period commencing on 1 July 2021 for the Victorian DNSPs*).; see also AER, *Final decision, United Energy distribution determination 2021 to 2026, Attachment 3—Rate of return confidential appendix A: Equity and debt averaging periods*, April 2021.

<sup>&</sup>lt;sup>33</sup> United Energy, 2021–26 Revised regulatory proposal, 3 December 2020, p. 128; and United Energy, Revised Regulatory Proposal - 2021–26 – MOD 10.02 – PTRM – March 2021.xls, March 2021.

benchmark approach using updated inputs. This results in equity raising costs of \$0.22 million.

Our final decision is to accept the method used in United Energy's revised proposal to estimate debt raising costs, which uses an annual rate of 8.1 basis points per annum.<sup>34</sup> We have considered this annual rate and found our alternative benchmark estimate (8.0 basis points) is similar to United Energy's proposal.

#### Imputation credits

Our final decision is to apply a gamma of 0.585 as provided in a modified 2018 Instrument.<sup>35</sup> United Energy's revised proposal has adopted a value of 0.585.<sup>36</sup>

#### Inflation

We estimate an expected inflation of 2.0 per cent based on the approach adopted in our final position paper from our 2020 inflation review.<sup>3738</sup> United Energy supported the new approach to estimating expected inflation, and advocated that the AER adopt the new approach immediately.<sup>39</sup>

#### True up for six month extension period

We applied placeholder averaging periods in our final decision for the six month extension period of 1 January 2021 to 30 June 2021.<sup>40</sup> This was because of the unanticipated delay in the passing of the NELA Act, and to facilitate our pricing process – the nominated (and accepted) averaging periods would not have finished in time to allow practical estimation of the final rate of return (based on the accepted averaging periods).

We have calculated the updated rate of return for the extension period based on the nominated and accepted averaging periods, and in accordance with the modified six-month instrument and the Order in Council. We determine that the difference with the placeholder rate of return will be recovered through the C-factor as noted in our control mechanisms attachment.

<sup>&</sup>lt;sup>40</sup> For example, see: AER, *Final decision United Energy six-month extension – variation decision*, October 2020, pp. 11–12.

## 2.3 Regulatory depreciation (return of capital)

Depreciation is the amount provided so capital investors recover their investment over the economic life of the asset (return of capital). United Energy invests capital in large assets to provide electricity network services to its consumers. The costs of these assets are recovered over the asset's useful life, which in many cases can be 50 or more years. This means only a small part of the cost of such assets are recovered from consumers upfront or in any year. The greater proportion is recovered over time through the depreciation allowance.

In deciding whether to approve the depreciation schedules submitted by United Energy, we make determinations on the indexation of the RAB and depreciation building blocks for United Energy's 2021–26 regulatory control period.<sup>41</sup> The regulatory depreciation amount is the net total of the straight-line depreciation less the indexation of the RAB.

Our final decision is to determine a regulatory depreciation amount of \$592.7 million (\$ nominal) for United Energy for the 2021–26 regulatory control period. This amount represents an increase of \$31.7 million (or 5.7 per cent) to the \$561.0 million (\$ nominal) in United Energy's revised proposal.<sup>42</sup> It is \$64.1 million (or 12.1 per cent) higher than the regulatory depreciation amount determined in the draft decision. This significant increase is driven by our review of lower expected inflation which resulted from our inflation review. This lower expected inflation (amongst other things) impacts the indexation component of the regulatory depreciation allowance.

In coming to this decision:

- We accept United Energy's revised proposed straight-line method to calculate the regulatory depreciation, which is consistent with our draft decision.
- We accept United Energy's revised proposal to continue with the year-by-year tracking approach to implement straight-line depreciation of existing assets, consistent with our draft decision. However, we have updated the inputs in the depreciation model for 2020 capex and the forecast equity raising costs and nominal rate of return inputs for the six month 2021 period, consistent with the RFM.
- We accept United Energy's revised proposed asset classes and standard asset lives, which are consistent with our draft decision. We have updated the equity raising costs standard life using our preferred weighted average approach.
- We accept United Energy's revised proposed reallocation of \$0.2 million of existing assets into its new asset class of 'Accelerated depreciation assets' from the 'Distribution system assets' class. This amount is consistent with the draft decision.<sup>43</sup>

<sup>&</sup>lt;sup>41</sup> National Energy Rules (NER), cll. 6.12.1, 6.4.3.

<sup>&</sup>lt;sup>42</sup> United Energy, *Revised Regulatory Proposal MOD 10.02 - PTRM 2021–26*, updated 24 March 2021.

<sup>&</sup>lt;sup>43</sup> Subject to an amendment in the depreciation model to reflect the output of the accelerated depreciation model. This amendment does not have a material impact on the depreciation (less than \$0.01 million).

The difference in our final decision and the revised proposed regulatory depreciation allowance is largely due to the following determinations on related parts of our decision:

- expected inflation over the 2021–26 regulatory control period (attachment 3)
- forecast capex (attachment 5) including its effect on the projected RAB over the 2021–26 regulatory control period.<sup>44</sup>

Further detail on our final decision regarding depreciation is set out in attachment 4.

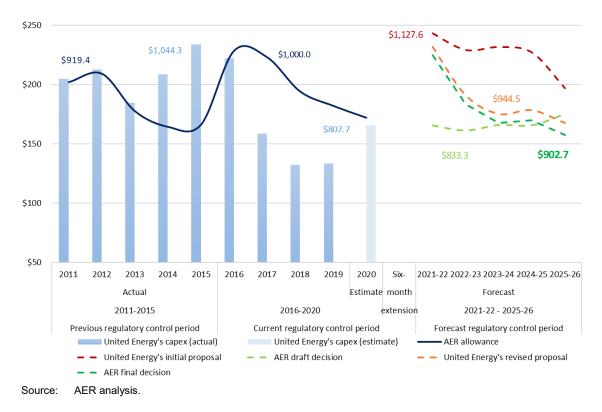

#### 2.4 Capital expenditure

Capex refers to the investment in assets to provide network services. This investment mostly relates to assets with long lives and these costs are recovered over several regulatory periods. Capex is added to United Energy's RAB, which is used to determine the return on capital and return of capital (regulatory depreciation) building block allowances. All else being equal, higher forecast capex will lead to a higher projected RAB value and higher return on capital and regulatory depreciation allowances.

Our final decision on United Energy's total net capex is to not accept its revised proposal of \$944.6 million (\$2020–21) for the 2021–26 regulatory control period. We are not satisfied that United Energy's revised total capex proposal reasonably reflects prudent and efficient costs. Our final decision includes a total net capex forecast of \$902.7 million (\$2020–21). This is 4 per cent below United Energy's revised forecast.

United Energy accepted several aspects of our draft decision, materially reducing its forecast capex by 16 per cent relative to its initial proposal. Figure 7 compares our total capex final decision, with United Energy's initial and revised proposal as well as its current period spend. While we acknowledge United Energy's efforts to reconsider its forecast in light of our concerns about its initial proposal in our draft decision, we would encourage it and other distributors to include in its initial proposal more substantiated capital expenditure requirements. We note that its initial forecast was 40 per cent above current period actual spend, with insufficient evidence to support its forecast in full. For the AER to be satisfied that a distributors forecast reasonably reflects the capex criteria, we expect initial proposals to be supported by quantitative business cases as well as reflect genuine engagement with its customer base.

<sup>&</sup>lt;sup>44</sup> Capex enters the RAB net of forecast disposals and capital contributions. It includes equity raising costs (where relevant) and the half-year WACC to account for the timing assumptions in the PTRM. Our final decision on the RAB (attachment 2) also reflects our updates to the WACC for the 2021–26 regulatory control period.

# Figure 7 Net capex: United Energy's historical and proposed capex, and AER's draft and final decision (\$ million, 2020–21)

In coming to our final decision, we asked United Energy questions on its revised proposal. United Energy was receptive to our questions and provided responses within requested timeframes. Our final decision is higher than our draft decision as United Energy provided sufficient evidence to satisfy us that parts of its revised forecast is prudent and efficient.

Our final decision provides a capex allowance that is 12 per cent above United Energy's current period spend. We are satisfied that this capex allowance is sufficient for United Energy to maintain its services level given that it has performed well on a number of network health indicators over the current period. Our decision does not preclude United Energy from changing the mix of capex projects and programs it has proposed for this review or from spending more than its capex allowance. Our regulatory framework recognises that circumstances may change over the course of the regulatory control period and that a distributor may need to reallocate capex to manage its risks.

Overall, we note the following:

- On replacement expenditure, in some cases we were satisfied that there was sufficient evidence to demonstrate its forecast was prudent and efficient, but we were not satisfied in other cases. For instance, we have accepted United Energy's forecast for its zone substation transformer program, but not accepted its revised proposal for service lines and poles.
- United Energy did not sufficiently demonstrate that a 50 per cent increase over current period wood poles repex is required to manage risks. We especially note United Energy's relatively low failure rates and its good performance for these assets across its network over the current period.

- We are satisfied that as a result of a change in circumstances since our draft decision, United Energy is required to relocate its Burwood depot. We have accepted United Energy's forecast on the basis that lower cost alternatives are no longer feasible to meet United Energy's property related regulatory obligations.
- A number of stakeholders, such as the Consumer Challenge Panel, sub-panel 17 (CCP17) and Victorian Community Organisations (VCO) expressed support for our draft decision.<sup>45</sup> The VCO questioned the proposed repex, submitting that United Energy has the option to spend more than the AER allowance if required, and can include capex overspends into the RAB if the overspend is prudent.<sup>46</sup> The CCP17 was largely supportive of our draft decision on capex, and agree that the current levels of historical capex appeared sufficient to support the safe and reliable provision of network services.<sup>47</sup> The VCO noted that our draft decision addressed the issues of capex in a reasonable manner, but considered that our draft decision allowances are still too high.<sup>48</sup>

Further detail on our final decision on capex is set out in attachment 5.

## 2.5 Operating expenditure

Opex is the forecast of operating, maintenance and other non-capital costs incurred in the provision of prescribed distribution standard control services. Forecast opex is one of the building blocks we use to determine United Energy's total regulated revenue requirement.

Our final decision is to accept United Energy's total opex forecast of \$728.7 million, including debt raising costs, for the 2021–26 regulatory control period. This is because our alternative estimate of \$722.8 million is not materially different than United Energy's updated revised total opex forecast proposal. Therefore we consider that United Energy's total opex forecast reasonably reflects the opex criteria.<sup>49</sup>

Figure 8 shows United Energy's opex forecast for the next five years, which is increasing by \$85.3 million or 13.3 per cent relative to its actual (and estimated) opex in the current regulatory control period.

#### Figure 8 United Energy's opex over time (\$ million, 2020–21)

Source: United Energy, *Revised Regulatory Proposal - 2021–26 - MOD 10.06 - Opex*, March 2021; AER, *Final Decision, United Energy distribution determination 2021–26, Opex model*, April 2021; AER, *Final Decision, United Energy distribution determination 2021–26, EBSS model*, April 2021; AER analysis.

We applied (as did United Energy) our top down base-step-trend approach to forecast increasing opex for the 2021–26 regulatory control period. This consists of:

- Starting with reported opex in 2019 as the opex base, which is lower than the forecast we set for the current regulatory control period, and we consider is reasonable as it is not materially inefficient.
- Escalating base opex to account for forecast changes in price growth, output growth and productivity over the next regulatory control period, which we consider is reasonable and consistent with our standard approach.
- Adding a number of base adjustments, step changes and category specific forecasts. The most significant step changes proposed are for increasing insurance premium costs and changes to security of critical infrastructure obligations. Other increases include costs to meet new obligations or relevant capex / opex trade-offs such as those for IT cloud solutions, five minute meter requirements, solar enablement and the reclassification of categories of repair works from capex to opex. We have assessed these and consider they are prudent and efficient. These additions are a key driver for forecast opex being higher than historical levels.

We have set out the reasons for our final decision on opex in more detail in attachment 6. Our opex model, which calculates our alternative estimate of opex, is available on our website.

#### 2.6 Corporate income tax

Our final decision on United Energy's estimated cost of corporate income tax is \$23.7 million over the 2021–26 regulatory control period. This represents an increase of \$13.3 million (or 127.6 per cent) from United Energy's revised proposed cost of corporate income tax of \$10.4 million (\$ nominal).The key reasons for this change are:

- Our final decision to reduce the immediately expensed capex for tax purposes from \$328.7 million to \$295.4 million (\$2020–21).<sup>50</sup>
- Our final decision to increase the regulatory depreciation (attachment 4).<sup>51</sup>
- Our final decision to apply an updated rate of return on equity (attachment 3).<sup>52</sup>
- Our final decision to reduce the revised proposed opening tax asset base (TAB) value as at 1 July 2021 by \$16.2 million to \$1998.5 million.<sup>53</sup>

We accept United Energy's revised proposal on the standard tax asset lives for all of its asset classes, consistent with our draft decision. We have updated United Energy's remaining tax asset lives as at 1 July 2021 to reflect our amendments to the opening TAB value.

We also accept United Energy's revised proposal for changing the tax treatment of gifted assets. The change in approach is consistent with a recent ruling by the Full Federal Court of Australia<sup>54</sup> made after the draft decision. Further detail on our final decision on corporate income tax is set out in attachment 7.

## 2.7 Revenue adjustments

Our final decision on United Energy's total revenue also includes a number of adjustments:

- EBSS we have calculated United Energy accrued EBSS carryovers totalling \$70.9 million (\$2020–21) from the application of the EBSS in the 2016–20 period. This is the same carryover amount United Energy included in its revised proposal. The EBSS is intended to provide a continuous incentive for distributors to pursue efficiency improvements in opex, and provide for a fair sharing of these between distributors and network users. Consumers benefit from improved efficiencies through lower forecast opex in subsequent periods. Attachment 8 sets out our final decision on United Energy's EBSS.
- CESS United Energy has accrued rewards under the CESS we applied in the current 2016–20 regulatory control period to incentivise United Energy to undertake efficient capex throughout the period. The CESS rewards efficiency gains and penalises efficiency losses, each measured by reference to the difference between forecast and actual capex. In the 2016–20 period, United Energy out-performed our capex forecast, and our final decision is to approve a CESS revenue increment amount of \$56.2 million (\$2020–21). This amount is higher than our draft decision

<sup>&</sup>lt;sup>50</sup> All else equal, a lower immediately expensed capex amount will increase the cost of corporate income tax because it reduces the tax expense.

<sup>&</sup>lt;sup>51</sup> All else equal, a higher regulatory depreciation amount will increase the cost of corporate income tax because it increases the taxable income.

<sup>&</sup>lt;sup>52</sup> All else equal, a higher rate of return on equity will increase the cost of corporate income tax because it reduces the return on equity, a component of the taxable income.

<sup>&</sup>lt;sup>53</sup> All else equal, a higher opening TAB value will increase the tax depreciation, a component of the tax expense, and lower the cost of corporate income tax.

<sup>&</sup>lt;sup>54</sup> Federal Court of Australia, Victoria Power Networks Pty Ltd v Commissioner of Taxation [2020] FCAFC 169, 21 October 2020.

forecast of \$49.7 as it reflects updated CPI, weighted average cost of capital (WACC), actual capex.

- Shared assets Distributors, such as United Energy, may use assets to provide both the SCS we regulate and unregulated services. These assets are called 'shared assets'. If the revenue from shared assets is material, ten per cent of the unregulated revenues that a distributor earns from shared assets will be used to reduce the distributor's revenue for SCS. For this final decision, we determine a revenue adjustment of \$4.7 million (\$2020–21) to be shared with customers across the 2021–26 regulatory control period.
- **DMIAM** —Table 6 sets out the DMIAM allowance for United Energy for the 2021– 26 regulatory control period, based on the final PTRM for United Energy. The DMIAM aims to encourage distribution businesses to find investments that are lower cost alternatives to investing in network solutions.

#### Table 6 AER's final decision on the DMIAM (\$ million, 2020–21)

	2021–22	2022–23	2023–24	2024–25	2025–26	Total
DMIAM	0.51	0.53	0.53	0.53	0.54	2.63

Source: AER analysis.

Section 4 sets out our final decision on the incentive schemes that apply to United Energy over the next regulatory control period.

## **3 United Energy's consumer Engagement**

A significant development in the preparation of proposals for the Victorian Electricity Distribution 2021–26 regulatory control period, has been the improvement in consumer engagement approaches undertaken by the distributors. Stakeholders have commented favourably on the observed improvement in consumer engagement across all Victorian distributors.<sup>55</sup> As a result of this advancement, we developed a framework<sup>56</sup> for assessing the Victorian distributor's consumer engagement activities, which we published in our draft decision.<sup>57</sup>

The framework sought to provide increased transparency around our assessment of consumer engagement outcomes and how this has influenced our decisions on expenditure forecasts. It was developed, based on our observations on the quality of engagement, to represent a range of considerations we thought clearly demonstrated if consumers had been genuinely engaged during development of proposals.<sup>58</sup> The Framework, in its current form, represents a high threshold a distributor would need to meet – among other things – should it be seeking to submit a proposal that is 'capable of acceptance'. Used in conjunction with our technical analysis, the framework allowed us to place weight on the outcomes of the engagement activities undertaken by each distributor to assist in providing an overall assessment of expenditure proposals. In response to a number of submissions<sup>59</sup>, this final decision also provides further clarity on the use of the framework in our decision making process. Noting that while we take the quality of consumer engagement, and the extent to which proposals are influenced by consumer preferences into account, it does not displace our technical assessment under the NER. The assessment of consumer engagement under the framework can however, inform the depth of technical assessment required.

Stakeholder submissions on our draft decision supported the framework<sup>60</sup>, as a tool in our kit, along with the further development of our approach to consumer engagement.<sup>61</sup> We also recognise there may be other elements of engagement which

<sup>&</sup>lt;sup>55</sup> CCP17, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, pp 6-42; CCP17, Submission on the Victorian Electricity Distribution Regulatory Proposal 2021–26, June 2020, p.10; Department of Environment, Land, Water and Planning, Victorian Government submission on the electricity distribution price review 2021–26, May 2020, p. 2, EUAA, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, p. 2; ECA, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, p. 6.

<sup>&</sup>lt;sup>61</sup> Op cit.

are also worthy of inclusion as our assessment approach develops.<sup>62</sup> As a result, we plan to take any further development of the framework in full in consultation with stakeholders, outside of the Victorian reset process. However, to maintain consistency of our assessment of the Victorian distributor's consumer engagement in this final decision, we have continued with the approach outlined in our draft decision.

#### 3.1 Clarifying the role of consumer engagement

Some stakeholders have expressed concern that an assessment of high quality consumer engagement may lead to a decreased level of technical assessment. In particular, the Energy Users Association of Australia and VCO submissions suggested that successful participation in a New Reg process could lead to a network business getting a 'rails run', with less detailed regulatory scrutiny.<sup>63</sup>

The NER outlines that we must have regard to consumer concerns and be satisfied that that expenditure forecasts we approve reasonably reflect prudent and efficient. One of the factors that we must have regard to is the extent to which the capex and opex forecasts address consumer concerns identified throughout distributors' engagement with its customers.<sup>64</sup> However, this must be balanced against other capex and opex factors, including that we must have regard to distributors' actual and expected capex and opex in preceding regulatory periods<sup>65</sup>, and whether the forecasts are consistent with any relevant incentive schemes.<sup>66</sup> Our technical analysis makes use of a range of measures, none of which are used deterministically in isolation. The quality of a distributor's consumer engagement informs the nature of our technical assessment but does not displace it.

### 3.2 An assessment of consumer engagement

In our assessment of consumer engagement in the development of proposals for the 2021–26 regulatory control period, we recognise that each distributor has approached consumer engagement differently.

CitiPower, Powercor and United Energy worked together on a common strategy to engage with their customers in the development of regulatory proposals for the three networks. The initial proposal outlined its 'Energised 2021–26' program, which consulted on a broad range of topics, across a diverse cross-section of the combined customer base. While this approach was considered a major strength, in our draft decision we concluded that this engagement was not clearly reflected in how it influenced their proposals.<sup>67</sup> Our draft decisions noted that, along with our top-down

<sup>&</sup>lt;sup>62</sup> CCP17, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, pp. 6-42; EUAA, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, pp. 3-4.; ECA, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, p. 9.; CitiPower, Powercor and United Energy, Revised Regulatory Proposal – 2021–26 - December 2020, p. 26.; VCO, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, pp. 12-13.

<sup>&</sup>lt;sup>63</sup> EUAA, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, p. 1; VCO, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021, p. 14

<sup>&</sup>lt;sup>64</sup> NER, cl. 6.5.7(e)(5A) and 6.5.6(e)(5A).

<sup>&</sup>lt;sup>65</sup> NER, cl. 6.5.7(e)(5) and 6.5.6(e)(5).

<sup>&</sup>lt;sup>66</sup> NER, cl. 6.5.7(e)(8) and 6.5.6(e)(8).

<sup>&</sup>lt;sup>67</sup> AER, Draft Decision – United Energy distribution determination 2021–26 Overview, September 2020, p. 4.

technical assessments, outcomes from United Energy's consumer engagement process was not sufficient to persuade us that a more thorough bottom-up analysis was not warranted. Further, that the increased expenditure forecasts should be accepted in the face of this bottom-up analysis.<sup>68</sup>

In response to our draft decision, we acknowledge that United Energy has taken on board our comments and the feedback of stakeholders regarding their engagement. For example, United Energy noted that while it believed its engagement had been 'broad and comprehensive' it also listened to stakeholder feedback to reshape its program to include a smaller panel, comprised of experienced members representing a cross section of customers across society.<sup>69</sup> This led to the establishment of its CAP<sup>70</sup>, which will also become part of their business as usual engagement with customers.<sup>71</sup> The CAP delved into "marque programs" and topics of engagement with the intent to provide feedback on reducing the revised proposal spending in line with customer preferences by testing the programs through informed discussions.<sup>72</sup>

In providing this assessment, we recognise that the limited timeframe, between the draft decision and submission of the revised proposals presented challenges for distributors to address all elements of our framework.

We observe that United Energy engagement with its CAP appears genuine and the distributors used the panel's expertise in the revised proposal.<sup>73 74</sup> A number of "marquee" programs that the CAP engaged on included, customer enablement, poles management and forecasting for COVID-19.<sup>75</sup> However, the CAP did not engage deeply on the total revised proposal package. The CCP17 did note this point, but concluded that while the CAP did not have an opportunity to review the revised proposals 'as a whole', they did not see it is a significant shortcoming.<sup>76</sup> In contrast, the VCO, noted in their submission that CitiPower, Powercor and United Energy were the most successful in engaging with 'different sectors within their base'.<sup>77</sup> The engagement of the CAP, can be seen as an important complementary function to the broad engagement already undertaken.

United Energy has provided greater explanation in its revised proposal documents, including sign-post tables outlining the engagement undertaken since submission of its initial proposal. It also outlined the feedback received from stakeholders and how its engagement for the revised proposal had been more targeted, including collaboration

<sup>&</sup>lt;sup>68</sup> AER, *Draft Decision – United Energy distribution determination 2021–26 Overview*, September 2020, p. 47.

<sup>&</sup>lt;sup>69</sup> United Energy, *Revised Regulatory Proposal, 2021–26*, December 2020 pp. 8, 14.

<sup>&</sup>lt;sup>70</sup> United Energy, *Revised Regulatory Proposal, 2021–26*, December 2020, p. 12.

<sup>&</sup>lt;sup>71</sup> United Energy, *Revised Regulatory Proposal, 2021–26*, December 2020, p. 12.

<sup>&</sup>lt;sup>72</sup> CitiPower, Powercor and United Energy have provided their CAP with detailed information packs to equip its members to allow for a deep and meaningful discussion. For an example see United Energy's supporting attachments provided by their consultant <u>Forethought Customer Engagement</u> and <u>CAP supporting documents</u>.

<sup>&</sup>lt;sup>73</sup> United Energy, *Revised Regulatory Proposal - 2021–26*, December 2020, p. 14.

<sup>&</sup>lt;sup>74</sup> United Energy, *Revised Regulatory Proposal - 2021–26*, December 2020, p. 18. CAP member Dean Lombard, noted the openness of the engagement, with CitiPower, Powercor and United Energy 'sharing key Information and having frank discussions with members about the issues at hand and the alternative approaches to them.

<sup>&</sup>lt;sup>75</sup> See United Energy - Revised Regulatory Proposal, 2021–26, Att 14, CAP Meeting 1 Minutes 2020; Att 20, CAP Meeting 2 Minutes; Att 27, CAP, Meeting 3 Minutes 2020, December 2020.

<sup>&</sup>lt;sup>76</sup> CCP17, Submission on the Victorian EDPR Revised Proposal and Draft Decision 2021–26, January 2021, p 3.

<sup>&</sup>lt;sup>77</sup> VCO, Submission on the Victorian EDPR Revised Proposal and draft decision 2021–26, January 2021 p. 13.

with the CAP.<sup>78</sup> ECA's consultant, Spencer&Co, were satisfied that the revised proposals 'adequately linked customers views to the outcomes proposed.'<sup>79</sup> We acknowledge the improvement that Untied Energy undertook to clearly identify the elements of its revised proposal that were shaped by discussions with its CAP. Given the limited timeframe, this may have contributed to the targeted discussions driven largely by United Energy on its "marquee programs", which limited consumers influence to other significant aspects of its revised proposal.

For example, United Energy revised proposal provided a 69 per cent reduction in its DER solar enablement program, noting stakeholder feedback that while they value the importance of DER, they suggested that the growth be reduced slightly, staged and prioritised, with less focus on physical augmentation.<sup>80</sup> This program was discussed and reviewed several times with the CAP and the final position adopted our draft decision.<sup>81</sup> The CCP17 commended United Energy for accepting this reduction and as a leader in Victoria, were interested to see 'how United Energy makes good use of the available funds for DER integration and 'smart' networks' over the next period'.<sup>82</sup>

United Energy's revised proposal largely accepted the main elements of our draft decision which elements are discussed further in sections 2.4 (capex) and 2.5 (opex). The CCP17 were supportive of our reduction in the draft decision relating to the proposed capital investment by United Energy.<sup>83</sup> They were also encouraged that United Energy accepted most of the matters raised in the draft decision and acknowledged 'removal of the forecast risk-driven pole intervention forecast, the updated information on the ICT tools required to meet improved customer service, and the further justification of the investment in depots'.<sup>84</sup>

CitiPower, Powercor and United Energy have acknowledged they are continuing to learn and improve their engagement approach.<sup>85</sup> We acknowledge the significant work undertaken following the draft decision with the initiative of the CAP however, there is still further work that can be done by United Energy to demonstrate that its customers are consistently understood and considered in its decisions.

Overall, while we have undertaken a more thorough bottom-up analysis of United Energy's proposal, we are confident that the consumer engagement undertaken since our draft decision with the CAP demonstrates progress towards establishing the proof points set out in our framework.

## 4 Incentive schemes

Incentive schemes are a component of incentive based regulation and complement our approach to assessing efficient costs. These schemes provide important balancing incentives under the revenue determination we've discussed in section 2 to encourage United Energy to pursue expenditure efficiencies and demand side alternatives, while maintaining the reliability and overall performance of its network.

The incentive schemes that might apply to an electricity distribution network as part of our decision are:

- EBSS
- CESS
- the service target performance incentive scheme (STPIS)
- the customer service incentive scheme (CSIS)
- the demand management incentive scheme (DMIS) and allowance (DMIAM).
- the f-factor scheme

Once we make our decision on United Energy's revenue cap, it has an incentive to provide services at the lowest possible cost, because its returns are determined by its actual costs of providing services. Our incentive schemes encourage network businesses to make efficient decisions. They give network businesses an incentive to pursue efficiency improvements in opex and capex, and to share them with consumers. If networks reduce costs to below our forecast of efficient costs, the savings are shared with its consumers in future regulatory periods through a lower opex allowance and a lower RAB.

We understand the strong concerns of stakeholders that the CESS not only rewards efficiency gains but also over forecasting and deferral of capex. The current CESS guideline includes protections against material deferrals that have been triggered for some elements of Powercor's proposal,<sup>86</sup> but not for United Energy. Protection against over forecasting of capex lies in the rigorous assessment of proposed capex.

The DMIS and the DMIAM provide businesses an incentive to undertake efficient expenditure on non-network options relating to demand management research and development in demand management projects that have the potential to reduce long-term network costs. All Victorian distributors accepted our draft decision to apply this scheme. We acknowledge that the Local Government Response expressed its concern that the full DMIAM allowance has been approved for Jemena, CitiPower and Powercor, without justification or evidence of the types of activities that will be undertaken.<sup>87</sup> While we acknowledge this concern, we consider that the DMIAM research and development works have the potential to deliver long-term savings to consumers. The scheme has an in-built control framework to ensure that only those

<sup>&</sup>lt;sup>86</sup> AER, Final Decision, Powercor Distribution Determination 2021–26, Attachment 9 Capital Expenditure Sharing Scheme, April 2021.

<sup>&</sup>lt;sup>87</sup> LGR, prepared by Victorian Greenhouse Alliance, *Submission to the AER Victorian Electricity Distribution Price Review (EDPR) 2021–26, Local Government Response to the AER's Draft Determination,* December 2020, p. 10.

expenditures that meet the tests prescribed by the scheme will be approved. Any unspent DMIAM allowance will be returned to the consumers.

Our final decision is to apply the DMIS<sup>88</sup> and the DMIAM<sup>89</sup> to United Energy for the 2021–26 regulatory control period, without any modification. Our draft decision reasons form part of this final decision.

The STPIS balances a business' incentive to reduce expenditure with the need to maintain or improve service quality. Our final decision is to apply our national STPIS version 2.0 (November 2018) to United Energy for the 2021–26 regulatory control period. We will not apply the guaranteed service level component to United Energy as the existing jurisdictional arrangements will continue to apply. We will not apply the STPIS telephone answering target and incentive rate to United Energy in the next regulatory control period because the distributor has opted to apply our CSIS in the revised proposal. However, United Energy should continue to report on the telephone answering parameter in the next regulatory control period. Attachment 10 sets out our final decision on United Energy's STPIS.

Our final decision is to apply CitiPower, Powercor and United Energy's proposed incentive design. The CSIS scheme replaces the current STPIS telephone answering parameter with a more holistic incentive that addresses its customer's preferences, as identified through a genuine and thorough engagement process. The performance targets are based on historical performance, with the revised revenue adjustment formula ensuring that incentives and penalties are commensurate to the value identified by customers. The scheme has been approved by CitiPower, Powercor and United Energy's CAP, and external stakeholders have also expressed support for the scheme in submissions. For each distributor the total revenue at risk for customer service performance will be 0.5 per cent of total revenue.

Our final decision is that each of the EBSS, CESS, STPIS, CSIS, DMIS and DMIAM should apply to United Energy for the 2021–26 regulatory control period.

Our final decision also includes how the f-factor scheme is applied to United Energy in the 2021–26 regulatory control period. The f-factor scheme is prescribed by the Victorian Government's F-Factor Scheme Order 2016 to reduce the risk of fire starts by network assets. <sup>90</sup> The 2016 Order was amended by the F-factor Scheme Amendment Order 2020. We have made an f-factor scheme determination for United Energy under the F-Factor Scheme Order in respect of the 2021–26 regulatory control period, as detailed in attachment A of our draft decision. Our final decision is to make revenue adjustments for United Energy in accordance with the F-Factor Scheme Order by way of an annual adjustment through the "I-factor" component in the control mechanism, as specified in attachment 14 of the final decision. We discuss our final decisions on each incentive scheme in attachments 8 to 12.

<sup>&</sup>lt;sup>88</sup> AER, Demand management incentive scheme, Electricity distribution network service providers, December 2017.

<sup>&</sup>lt;sup>89</sup> AER, *Demand management innovation allowance mechanism*, *Electricity distribution network service providers*, December 2017.

<sup>&</sup>lt;sup>90</sup> Victoria Government Gazette, G 51, 22 December 2016, p. 3239.

# **5** Tariff structure statement

United Energy's 2021–26 proposal includes the second iteration of its tariff structure statement (TSS). Its current TSS applies from 1 January 2016 to 30 June 2021.<sup>91</sup>

The requirement on distributors to prepare a TSS arises from significant reforms to the rules governing distribution network pricing. These reforms aim to:

- help distributors provide better price signals to retailers to reflect what it costs to use the network
- manage future expectations for retailers, distributors and consumers by providing guidance on distributors' tariff strategy
- help the transition to more cost reflecting pricing.

Distributors do not directly charge end customers. Rather, distributors charge retailers for the network services provided to end customers. Retailers can then decide how best to pass on these price signals to end customers.

A TSS applies to a distributor's tariffs for the duration of the regulatory control period. It describes a distributor's tariff classes and structures, the distributor's policies and procedures for assigning and reassigning customers to tariffs, the charging parameters for each tariff, and a description of the approach the distributor takes to setting tariffs in pricing proposals.<sup>92</sup> It is accompanied by an indicative pricing schedule.<sup>93</sup> A TSS provides consumers and retailers with certainty and transparency in relation to how and when network prices will change.

While an indicative pricing schedule must accompany the TSS, United Energy's tariffs for the entire 2021–26 regulatory control period are not set as part of this determination. Rather, tariffs for 2021–22 will be subject to a separate approval process that takes place in May 2021, after this final revenue determination in April 2021. Tariffs for the following four years will also be approved on an annual basis in May of each year.

Our final decision is to amend United Energy's TSS by:

- requiring stand-alone (grid scale) storage face network price signals to guide their operation and contribute to the cost of operating and maintaining the electricity distribution networks they use
- specifying electric vehicles owners, once they are identified by the relevant network, will no longer have access to flat tariffs
- clarifying retailers can request tariff reassignment from distributors to help optimise their portfolios while consumers retain control over their retail offer
- reducing the minimum chargeable demand for its HV customers from 1000 kVA to 500 kVA and sub-transmission customers from 10 000 kVA to 5000kVA

<sup>&</sup>lt;sup>91</sup> The regulatory control period (1 January 2016 to 31 December 2020) was extended by six months. Refer to the Executive Summary above for an overview of changes to the regulatory control period.

<sup>&</sup>lt;sup>92</sup> NER, cl. 6.18.1A(a).

<sup>&</sup>lt;sup>93</sup> NER, cl. 6.18.1A(e).

- permitting it modifies its sub-transmission pricing structure to remain unchanged until the AER's final decision on the Australian Energy Market Operator's Designated pricing proposal charges pricing methodology in Victoria
- providing greater detail on tariff trials in the first year of the regulatory control period.

These amendments complement the changes United Energy already made to align with our draft decision. These changes include:

- reassignment of residential consumers on legacy time of use, flexibility and demand tariffs to the new time of use or demand equivalent
- increasing the peak to off-peak ratio of the residential time of use tariffs to maintain the established ratios which incentivise consumers to respond
- providing greater clarity about continued access for consumers with consumption under 160 MWh a year but demand greater than 120 kVA to a zero demand tariff structure
- refining large user peak charging windows to more closely target network conditions
- provided further flexibility to allow large customers to be reassigned to the small business tariff class
- providing greater clarity on how its tariff strategy aligned with DER integration and demand management initiatives

On large customer tariff choice, our final decision is to allow United Energy to

• not offer large user tariff choice at this time given the tight timelines between our draft decision and its revised proposal, as well as its intention to trial new large customer tariffs during the 2021–26 regulatory control period.

On energy storage, we consider batteries should contribute to recovery of network costs and should face network price signals to guide their operation. This will retain consistency with other NEM jurisdictions given the absence of new rules or policy direction between our draft and final decisions. If the asset falls into a particular tariff class, it should be assigned to the same network tariffs as other customers in that tariff class, whether owned by a distributor, its affiliate or a third party. We have amended United Energy's TSS to reflect this position. To the extent batteries are used for network support they are exempt from network tariffs, as they are currently.

We note the AEMC has foreshadowed its intention to consult with stakeholders on efficiently integrating distributed energy resources and that charging arrangements may be considered more generally in the context of the Energy Security Board reforms. The Victorian distributors have also committed to trialling new tariffs for energy storage over the 2021–26 regulatory control period.

Attachment 19 of this final decision provides detailed reasons for our decision on United Energy's TSS.

# 6 Other price terms and conditions

In this section, we consider the other aspects of our determination. These may be described as the terms and conditions of our determination that cover how United Energy must set its prices. This includes the classification of services and the framework for United Energy's negotiated services.

### 6.1 Classification of services

Service classification determines the nature of economic regulation, if any, that is applicable to specific distribution services. Classification is important to customers as it determines which network services are included in basic electricity charges, the basis on which additional services are sold, and which services we will not regulate. Our decision reflects our assessment of a number of factors, including existing and potential competition to supply these services.

In its revised proposal, United Energy accepted our draft decision on the classification of the services it provides.<sup>94</sup> Our final decision is to retain the classification structure and the services list as published in our draft decision for United Energy.<sup>95</sup> The list of classified services United Energy will provide for 2021–26 is set out in attachment 13 of this decision.

### 6.2 Negotiating framework and criteria

In our draft decision, we approved United Energy's proposed distribution negotiating framework for the 2021–26 regulatory control period.<sup>96</sup> We did not receive any objections or submissions on our draft decision. Our final decision is to approve United Energy's negotiating framework. The distribution negotiating framework that will apply to United Energy for the period of this determination is set out in attachment A. We are also required to make a decision on the negotiated distribution service criteria (NDSC) for the distributor.<sup>97</sup> Our final decision is to retain the NDSC that we published for United Energy in September 2020<sup>98</sup> for the 2021–26 regulatory control period. The NDSC gives effect to the negotiated distribution services principles.<sup>99</sup>

### 6.3 Connection policy

In our draft decision, we did not approve United Energy's proposed connection policy for the 2021–26 regulatory control period. We modified United Energy's connection policy nominated in its original proposal, to the extent necessary to enable it to be approved in accordance with the rules.

<sup>&</sup>lt;sup>94</sup> United Energy, *Revised Regulatory proposal, 2021–26* - December 2020, p. 118.

<sup>&</sup>lt;sup>95</sup> AER, *Draft decision United Energy distribution determination 2021–26*, Attachment 12 Classification of services, September 2020. The services list can be found in Attachment A

<sup>&</sup>lt;sup>96</sup> AER Draft decision United Energy distribution determination 2021–26, September 2020, Attachment 17, p, 17-4

<sup>&</sup>lt;sup>97</sup> NER, cl. 6.12.1(16).

 <sup>&</sup>lt;sup>98</sup> AER, *Draft decision United Energy distribution determination 2021–26*, September 2020, Attachment 17, p, 17-4
 <sup>99</sup> NER, cl. 6.7.1.

United Energy accepted the majority of the changes we made to its initially proposed connection policy. However, it did not accept the threshold level for what size new connections needs to contribute the upstream cost in addition to the network extension cost set in the draft decision. United Energy also proposed a new change to its original proposal to include the tax liability to the capital contribution for large embedded generator connections.

We do not agree to these proposed changes, because:

- United Energy's proposed threshold is not consistent with our Connection Charge Guideline published under the NER, 100A 3 phase supply.
- United Energy did not consult with the relevant stakeholders regarding the proposed change to include tax liability to the capital contribution for large embedded generator connections, since such change will result in a step change to its existing practice.

The approved connection policy for United Energy's 2021–26 regulatory control period is appended to attachment 18 of our final decision.

### 7 The National Electricity Law and Rules

The NEL and NER provide the regulatory framework governing electricity distribution networks. Our work under this framework is guided by the NEO:<sup>100</sup>

"...to promote efficient investment in, and efficient operation and use of, electricity services for the long term interests of consumers of electricity with respect to—

- (a) price, quality, safety, reliability and security of supply of electricity; and
- (b) the reliability, safety and security of the national electricity system."

The NEL requires us to make our decision in a manner that contributes, or is likely to contribute, to achieving the NEO.<sup>101</sup> The focus of the NEO is on promoting efficient investment in, and operation and use of, electricity services (rather than assets) in the long-term interests of consumers.<sup>102</sup> This is not delivered by any one of the NEO's factors in isolation, but rather by balancing them in reaching a regulatory decision.<sup>103</sup>

Electricity determinations are complex decisions. In most cases, the provisions of the NER do not point to a single answer, either for our decision as a whole or in respect of particular components. They require us to exercise our regulatory judgement. Where there are choices to be made among several plausible alternatives, we have selected what we are satisfied would result in an overall decision that is likely to contribute to the achievement of the NEO to the greatest degree.<sup>104</sup>

Our distribution determinations are predicated on a number of constituent decisions that we are required to make.<sup>105</sup> These are set out in appendix A and the relevant attachments. In coming to a decision that contribute to the achievement of the NEO, we have considered interrelationships of the constituent components of our final decision in the relevant attachments. Examples include:

- underlying drivers and context which are likely to affect many constituent components of our decision. For example, forecast demand affects the efficient levels of capex and opex in the regulatory control period (see attachment 5 and 6).
- direct mathematical links between different components of a decision. For example, the level of gamma has an impact on the appropriate tax allowance; the benchmark efficient entity's debt to equity ratio has a direct effect on the cost of equity, the cost of debt, and the overall vanilla rate of return (see attachments 3 and 7).

<sup>&</sup>lt;sup>100</sup> NEL, s. 7.

<sup>&</sup>lt;sup>101</sup> NEL, section 16(1)(a)

<sup>&</sup>lt;sup>102</sup> This is also the view of the Australian Energy Markets Commission (the AEMC). See, for example, the AEMC, 'Applying the Energy Objectives: A guide for stakeholders', 1 December 2016, p. 5.

<sup>&</sup>lt;sup>103</sup> Hansard, SA House of Assembly, 26 September 2013, p. 7173. See also the AEMC, 'Applying the Energy Objectives: A guide for stakeholders', 1 December 2016, pp. 7–8.

<sup>&</sup>lt;sup>104</sup> NEL, s. 16(1)(d).

<sup>&</sup>lt;sup>105</sup> NER, 6.12.1

trade-offs between different components of revenue. For example, undertaking a
particular capex project may affect the need for opex or vice versa (see
attachments 5 and 6).

In general, we consider that the long-term interests of consumers are best served where consumers receive a reasonable level of safe and reliable service that they value at least cost in the long run.<sup>106</sup> A decision that places too much emphasis on short term considerations may not lead to the best overall outcomes for consumers once the longer term implications of that decision are taken into account.<sup>107</sup>

There may be a range of economically efficient decisions that we could make in a revenue determination, each with different implications for the long-term interests of consumers.<sup>108</sup> A particular economically efficient outcome may nevertheless not be in the long-term interests of consumers, depending on how prices are structured and risks allocated within the market.<sup>109</sup> There are also a range of outcomes that are unlikely to advance the NEO, or advance the NEO to the degree than others would. For example, we consider that:

- the long-term interests of consumers would not be advanced if we encourage overinvestment which results in prices so high that consumers are unwilling or unable to efficiently use the network.<sup>110</sup>
- equally, the long-term interests of consumers would not be advanced if allowed revenues result in prices so low that investors do not invest to sufficiently maintain the appropriate quality and level of service, and where consumers are making more use of the network than is sustainable leading to safety, security and reliability concerns.<sup>111</sup>

<sup>&</sup>lt;sup>106</sup> Hansard, SA House of Assembly, 9 February 2005, p. 1452.

<sup>&</sup>lt;sup>107</sup> See, for example, AEMC, 'Applying the Energy Objectives: A guide for stakeholders', 1 December 2016, pp. 6–7.

<sup>&</sup>lt;sup>109</sup> See, for example, the AEMC, 'Applying the Energy Objectives: A guide for stakeholders', 1 December 2016, p. 5.

<sup>&</sup>lt;sup>110</sup> NEL, s. 7A(7).

<sup>&</sup>lt;sup>111</sup> NEL, s. 7A(6).

# A Constituent decisions

### **Constituent decision**

In accordance with clause 6.12.1(1) of the NER, the AER's final decision is that the classification of services set out in Attachment 13 will apply to United Energy for the 2021–26 regulatory control period.

In accordance with clause 6.12.1(2)(i) of the NER, the AER's final decision is not to approve the annual revenue requirement set out in United Energy building block proposal. Our decision on United Energy' annual revenue requirement for each year of the 2021–26 regulatory control period is set out in Attachment 1 of the final decision.

In accordance with clause 6.12.1(2)(ii) of the NER, the AER's final decision is to approve United Energy' proposal that the regulatory control period will commence on 1 July 2021. In accordance with clause 6.12.1(2)(ii) of the NER, the AER's final decision is to approve United Energy' proposal that the length of the regulatory control period will be five years from 1 July 2021 to 30 June 2026.

The AER did not receive a request for an asset exemption under clause 6.4.B.1 (a) (1) and therefore has not made a decision in accordance with clause 6.12.1(2A) of the NER.

In accordance with clause 6.12.1(3)(ii) and acting in accordance with clause 6.5.7(d) of the NER, the AER's final decision is not to accept United Energy' proposed total forecast capital expenditure of \$944.6 million (\$2020–21). Our final decision therefore includes a substitute estimate of United Energy' total forecast capex for the 2021–26 regulatory control period of \$902.7million (\$2020–21). The reasons for our final decision are set out in Attachment 5.

In accordance with clause 6.12.1(4)(i) of the NER and acting in accordance with clause 6.5.6(c), the AER's final decision is to accept United Energy's proposed total forecast operating expenditure, inclusive of debt raising costs and exclusive of DMIAM of \$728.7 million (\$2020–21). The reasons for our final decision are set out in Attachment 6.

United Energy did not propose any contingent projects and therefore the AER has not made a decision under clause 6.12.1(4A) of the NER.

In accordance with clause 6.12.1(5) of the NER and the modified 2018 Rate of Return Instrument for the regulatory control period commencing on 1 July 2021 for the Victorian DNSPs set out in the Order in Council made under section 16VE of the amended National Electricity (Victoria) Act 2005 (Vic), the AER's final decision is that the allowed rate of return for the 2021–22 regulatory year is 4.76 per cent (nominal vanilla) as set out in Attachment 3 of the final decision. The rate of return for the remaining regulatory years 2022–26 will be updated annually because our decision is to apply a trailing average portfolio approach to estimating debt which incorporates annual updating of the allowed return on debt.

In accordance with clause 6.12.1(5A) of the NER and the modified 2018 Rate of Return Instrument for the regulatory control period commencing on 1 July 2021 for the Victorian DNSPs set out in the Order in Council made under section 16VE of the amended National Electricity (Victoria) Act 2005 (Vic), the AER's final decision on the value of imputation credits as referred to in clause 6.5.3 is to adopt a value of 0.585. This is discussed in section 2.2 of this final decision Overview.

In accordance with clause 6.12.1(6) of the NER, the AER's final decision on United Energy' regulatory asset base as at 1 July 2021 in accordance with clause 6.5.1 and schedule 6.2 is \$2392.9 million (\$ nominal). This is discussed in Attachment 2 of the final decision.

### **Constituent decision**

In accordance with clause 6.12.1(7) of the NER, the AER's final decision on the estimate of United Energy's corporate income tax is \$23.7 million (\$ nominal) for the 2021–26 regulatory control period. This comprises (\$ nominal):

- \$3.7 million in 2021–22,
- \$3.4 million in 2022–23,
- \$3.3 million in 2023–24,
- \$6.3 million in 2024–25 and
- \$7.1 million in 2025–26.

This is discussed in Attachment 7 of the final decision.

In accordance with clause 6.12.1(8) of the NER, the AER's final decision is to not approve the depreciation schedules submitted by United Energy. Our final decision substitutes alternative depreciation schedules that accord with clause 6.5.5(b) and this is discussed in Attachment 4 of the final decision.

In accordance with clause 6.12.1(9) of the NER the AER makes the following final decisions on how any applicable efficiency benefit sharing scheme (EBSS), capital expenditure sharing scheme (CESS), service target performance incentive scheme (STPIS), demand management incentive scheme (DMIS), demand management innovation allowance mechanism (DMIAM) or small-scale incentive scheme (customer service incentive scheme) is to apply:

- We will apply version 2 of the EBSS to United Energy in the 2021–26 regulatory control period. This is discussed in Attachment 8 of the final decision.
- We will apply the CESS as set out in version 1 of the Capital Expenditure Incentives Guideline to United Energy in the 2021–26 regulatory control period. This is discussed in Attachment 9 of the final decision.
- We will apply our Service Target Performance Incentive Scheme (STPIS) to United Energy for the 2021–26 regulatory control period. This is discussed in Attachment 10 of the final decision.
- We will apply the DMIS and DMIAM to United Energy for the 2021–26 regulatory control period. This is discussed in the Overview of the final decision.
- We will apply the customer service incentive scheme (CSIS) to United Energy for the 2021– 26 regulatory control period. This is discussed in attachment 12 of the draft decision.

In accordance with clause 6.12.1(10) of the NER, the AER's final decision is that all other appropriate amounts, values and inputs are as set out in this final determination including attachments.

In accordance with clause 6.12.1(11) of the NER and our framework and approach paper, the AER's final decision on the form of control mechanisms (including the X factor) for standard control services is a revenue cap. The revenue cap for United Energy for any given regulatory year is the total annual revenue calculated using the formulae in Attachment 14, which includes any adjustment required to move the DUoS unders and overs account to zero. This is discussed in Attachment 14 of the final decision.

In accordance with clause 6.12.1(12) of the NER and our framework and approach paper, the AER's final decision on the form of the control mechanism for alternative control services is to apply a revenue cap for type 5 and 6 metering (including smart metering) services and price

### **Constituent decision**

caps for all other services. The revenue cap for United Energy's type 5 and 6 metering (including smart metering) services for any given regulatory year is the total annual revenue for type 5 and 6 (Including smart metering) services calculated using the formulae in Attachment 14, which includes any adjustment required to move the metering unders and overs account to zero. This is discussed in Attachment 14 of the final decision.

In accordance with clause 6.12.1(13) of the NER, to demonstrate compliance with its distribution determination, the AER's final decision is that United Energy must maintain a DUoS unders and overs account and a metering unders and overs account. It must provide information on these accounts to us in its annual pricing proposal. This is discussed in Attachment 14 of the final decision.

In accordance with clause 6.12.1(14) of the NER, the AER's final decision is to apply the following nominated pass through events to United Energy for the 2021–26 regulatory control period in accordance with clause 6.5.10:

- Terrorism event
- Insurance coverage event
- Natural disaster event
- Insurer credit risk event
- Retailer insolvency event.

These events have the definitions set out in Attachment 15 of the final decision.

In accordance with clause 6.12.1(14A) of the NER, the AER's final decision is to not approve the tariff structure statement proposed by United Energy. This is discussed in Attachment 19 of the final decision.

In accordance with clause 6.12.1(15) of the NER, the AER's final decision is that the negotiating framework as proposed by United Energy will apply for the 2021–26 regulatory control period. This is discussed in section 6.2 of this final decision overview and the negotiating framework is in Attachment A of this final decision.

In accordance with clause 6.12.1(16) of the NER, the AER's final decision is to apply the negotiated distribution services criteria, published in our draft decision in September 2020, to United Energy for the 2021–26 regulatory control period. This is set out in section 6.2 of this final decision overview.

In accordance with clause 6.12.1(17) of the NER, the AER's final decision on the procedures for assigning and reassigning retail customers to tariff classes for United Energy is set out in Attachment 19 of the final decision.

In accordance with clause 6.12.1(18) of the NER, the AER's final decision is that the depreciation approach based on forecast capex (forecast depreciation) is to be used to establish the RAB at the commencement of United Energy' regulatory control period as at 1 July 2026. This is discussed in Attachment 2 of the final decision.

In accordance with clause 6.12.1(19) of the NER, the AER's final decision on how United Energy is to report to the AER on its recovery of designated pricing proposal charges for each regulatory year of the 2021–26 regulatory control period and on the adjustments to be made to subsequent pricing proposals to account for over or under recovery of those charges is to set this out in its annual pricing proposal. The method to report recovery of the charges and

#### **Constituent decision**

account for the under or over recovery of designated pricing proposal charges is discussed in Attachment 14 of the final decision.

In accordance with clause 6.12.1(20) of the NER, the AER's final decision on how United Energy is to report to the AER on its recovery of jurisdictional scheme amounts for each regulatory year of the 2021–26 regulatory control period and on the adjustments to be made to subsequent pricing proposals to account for over or under recovery of those charges is to set this out in its annual pricing proposal. The method to report recovery of the charges and account for the under or over recovery of jurisdictional scheme amounts is discussed in Attachment 14 of the final decision.

In accordance with clause 6.12.1(21) of the NER, the AER's final decision is to not approve the connection policy proposed by United Energy. Our final decision is to amend United Energy's proposed connection policy as set out in Attachment 18 of the final decision.

In accordance with section 16C of the National Electricity (Victoria) Act 2005, the NEL, the NER and the "f-factor scheme order 2016", <sup>112</sup> the AER's final decision is to apply the f-factor incentive payments/penalties as a part of the "I-factor" adjustment to the calculation of the total annual revenue requirement using the formulae in Attachment 14 of the final decision.

<sup>&</sup>lt;sup>112</sup> http://www.gazette.vic.gov.au/gazette/Gazettes2016/GG2016G051.pdf, Victoria Government Gazette, G 51 22 December 2016, p. 3239.

## **B** List of submissions

We received public submissions from the following stakeholders on our draft decision and United Energy's revised proposal:

Stakeholder
AGL
Ausgrid
Consumer Challenge Panel 17
Electric Vehicle Council
EnergyAustralia
Energy Consumers Australia
Energy Users Association of Australia
Evie Networks
Firm Power
Groundline Engineering
Jemena Electricity Networks People's Panel
Local Government Response, prepared by Victorian Greenhouse Alliances
Origin Energy
Red Energy and Lumo Energy

Victorian Community Organisations, prepared by Brotherhood of St Laurence, Renew, Victorian Council of Social Service

# C Consumer engagement framework

The following table represented the framework outlined in our draft decision for considering consumer engagement.<sup>113</sup>

Element	Examples of how this could be assessed	
Nature of engagement	Consumers partner in forming the proposal rather than asked for feedback on distributor's proposal	
	<ul> <li>Relevant skills and experience of the consumers, representatives, and advocates</li> </ul>	
	Consumers provided with impartial support to engage with energy sector issues	
	Sincerity of engagement with consumers	
	Independence of consumers and their funding	
	Multiple channels used to engage with a range of consumers across a distributor's consumer base	
Breadth and depth	Clear identification of topics for engagement and how these will feed into the regulatory proposal	
	Consumers consulted on broad range of topics	
	Consumers able to influence topics for engagement	
	<ul> <li>Consumers encouraged to test the assumptions and strategies underpinning the proposal</li> </ul>	
	Consumers were able to access and resource independent research and engagement	
Clearly evidenced impact	Proposal clearly tied to expressed views of consumers	
	<ul> <li>High level of business engagement, e.g. consumers given access to the distributor's CEO and/or board</li> <li>Distributors responding to consumer views rather than just recording them</li> </ul>	
	Impact of engagement can be clearly identified	
	Submissions on proposal show consumers feel the impact is consistent with their expectations	
Proof point	Reasonable opex and capex allowances proposed	
	$\circ$ In line with, or lower than, historical expenditure	
	<ul> <li>In line with, or lower than, our top down analysis of appropriate expenditure</li> </ul>	
	<ul> <li>If not in line with top down, can be explained through bottom up category analysis</li> </ul>
