Contents

1 Introduction

In December 2018 the AER published the first rate of return instrument (2018 instrument).[1]

This binding instrument specifies how we determine the allowed rate of return on capital invested in regulated electricity and gas networks for the following four year period. The rate of return is a significant driver of regulated revenue, and estimation of the rate of return is complex and contentious. The next rate of return instrument (2022 instrument) will be published in December 2022.

The intent of our annual update series is to provide stakeholders with regular information on rate of return data, particularly time series market data, showing changes since the publication of the 2018 instrument.[2] We have not attempted to update all data series considered during the 2018 review, but have selected content with regard to its importance and practical considerations such as availability of data.

The tables and figures in this update have been prepared using our existing calculation approaches, as used to inform the 2018 instrument, so that stakeholders can compare changes in market data on a consistent basis.[3] If there is a new method of analysis arising from a final working paper, we have included both the new measure and the 2018 method for comparability.[4]

Relative to the 2019 update,[5] this update includes additional data arising from our *Energy networks debt data* final working paper:[6]

- additional analysis on the energy infrastructure credit spread index (EICSI) reweighted by tenor

- the EICSI based on our risk free rate estimate rather than the current bank bill swap rate (BBSW)

- the weighted average term to maturity at issuance (WATMI) using EICSI yield data.

Our intent is that this annual update helps to provide a foundation for substantive, constructive discussion with all stakeholders during the active phase of the 2022 review.

---

[1] AER, *Rate of return instrument*, December 2018 (v1.02 as amended April 2019).

[2] We see the annual rate of return update as complementary to our working paper series, which facilitates discussion on the interpretation of the available data or methodological issues.

[3] See AER, *Rate of return instrument, Explanatory statement*, December 2018.

[4] In several areas our rate of return estimates are informed by proprietary data, which we report in aggregated form in order to protect confidentiality.

[5] AER, *Rate of return, Annual update*, December 2019, available at https://www.aer.gov.au/networks-pipelines/guidelines-schemes-models-reviews/rate-of-return-annual-updates-2019%E2%80%932022/update.

2 Indicative rate of return

Table 1 presents key rate of return parameters and an indicative rate of return given the application of the 2018 instrument using current market data. To that end, in Table 1 we have:

- updated those parameters where the 2018 instrument specifies a method informed by market data at each regulatory determination.

- kept constant those parameters where the 2018 instrument specifies that the value is fixed.

Table 1 Key components of the regulated rate of return (2018 to 2020)

Parameter	2018 Instrument (as at November 2018)	2019 annual update (as at August 2019)	2020 annual update (as at August 2020)
Indicative overall rate of return (nominal vanilla)	5.36%	3.45%	3.27%
Gearing ratio	60%	60%	60%
Indicative return on debt (annual estimate)	4.70%	2.69%	2.40%
Market risk premium	6.10%	6.10%	6.10%
Equity beta	0.60	0.60	0.60
Indicative risk free rate	2.70%	0.94%	0.91%
Indicative return on equity	6.36%	4.60%	4.57%
Value of imputation credits (gamma)	0.585	0.585	0.585
Benchmark credit rating	BBB+	BBB+	BBB+

Comparator: Table 1 (pages 13–16) of the 2018 explanatory statement.

Notes: Uses indicative averaging period across all business days in November 2018 (2018 instrument), 20 business days to 31 August 2019 (2019 update) and 20 business days to 31 August 2020 (this annual update). Indicative rates are based on 'on-the-day' return on debt estimates and do not reflect a trailing average portfolio.

Source: AER analysis, AER, *Rate of return instrument*, December 2018 (v1.02 as amended April 2019).

The indicative return on debt presented in Table 1 is an on-the-day rate, reflecting the annual (spot) cost of debt in the indicative averaging period. As specified in the 2018 instrument, energy networks are in the process of transitioning from an on-the-day approach to a trailing average portfolio that reflects ten years of historical return on debt. The transition itself takes ten years. The regulated return on debt for each service provider will therefore depend on the date at which it commenced the transition to the trailing average portfolio approach.

3 Gearing

3.1 Estimation based on market values

Table 2 presents gearing estimates for five comparator businesses over the past five and ten years using market values of equity and debt (with book value of debt used as a proxy for the market value of debt).[7]

Table 2   Gearing based on market values (2006 to 2020)

Year	ENV	APA	DUE	AST	SKI	Average
2006	66%	51%	79%	56%	60%	62%
2007	65%	59%	67%	55%	57%	61%
2008	77%	73%	76%	59%	70%	71%
2009	75%	68%	80%	70%	70%	73%
2010	74%	61%	80%	64%	65%	69%
2011	66%	53%	79%	64%	62%	65%
2012	63%	47%	72%	59%	59%	60%
2013	53%	46%	71%	57%	62%	58%
2014	47%	45%	64%	58%	55%	54%
2015		50%	62%	59%	56%	57%
2016		49%	51%	57%	51%	52%
2017		49%		52%	50%	50%
2018		45%		56%	54%	52%
2019		45%		55%	57%	52%
2020		45%		59%		52%
5 year average		**47%**	**51%**	**56%**	**53%**	**52%**
10 year average	**57%**	**47%**	**66%**	**58%**	**56%**	**55%**

Comparator: Table 4 (page 65) of the 2018 explanatory statement.

Notes: Spark Infrastructure (SKI) estimates are as at 31 December each year. AusNet Services (AST) estimates are as at 31 March each year. Duet Group (DUE), APA Group (APA) and Envestra (ENV) estimates are as at 30 June each year. The average for all firms in a year does not make any adjustment for these timing differences.

Source: Annual reports, AER analysis; AusNet services, *Annual report 2020*, March 2020, p. 53, 121; APA, *Annual report 2020*, August 2020, p. 9, 49, 103; Spark Infrastructure, *2019 Annual report,* February 2020, p. 3, 63, 104; Spark Infrastructure, *31 December 2019 Full year factbook,* February 2020, p. 8, 12, 16; other data is the same as published with the explanatory statement.

---

[7]   Our gearing estimation method is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 64–72.

3.2 Estimation based on book values

Table 3 presents gearing estimates for five comparator businesses over the past five and ten years using book values of equity and debt.[8]

Table 3 Gearing based on book values (2006 to 2020)

Year	ENV	APA	DUE	AST	SKI	Average
2006	91%	67%	82%	57%	81%	76%
2007	90%	69%	75%	57%	80%	74%
2008	82%	71%	76%	58%	89%	75%

Comparator: Table 5 (page 66) of the 2018 explanatory statement.

Notes: Spark Infrastructure (SKI) estimates are as at 31 December each year. AusNet Services (AST) estimates are as at 31 March each year. Duet Group (DUE), APA Group (APA) and Envestra (ENV) estimates are as at 30 June each year. The average for all firms in a year does not make any adjustment for these timing differences.

Source: As per Table 2. Annual reports, AER analysis; AusNet services, *Annual report 2020*, March 2020, p. 77; APA, *Annual report 2020*, August 2020, p. 64; Spark Infrastructure, *2019 Annual report,* February 2020, p. 85; all other data is the same as published with the explanatory statement.

---

[8] Our gearing estimation method is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 64–72.

4 Risk free rate

The risk free rate is an important parameter in the calculation of return on equity, which we estimate using the yield on Commonwealth Government Securities (CGS).[9]

Figure 1 10 year interpolated CGS yields (January 2013 to August 2020)

Comparator: Figure 10 (page 133) of the 2018 explanatory statement.

Source: RBA interest rate statistics F16, AER analysis.

---

[9] Our use of the risk free rate is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 125–141.

5 Equity Beta

The equity beta is a key parameter within the Sharpe–Lintner CAPM which we use to estimate the return on equity. It measures the 'riskiness' of a firm's returns compared with that of the market. Specifically, the equity beta measures the standardised correlation between the returns on an individual asset or firm with that of the overall market.[10]

In determining a value for equity beta in the 2018 Instrument, we considered empirical estimates of equity beta from relevant Australian energy network businesses (domestic estimates) and international energy network businesses.[11] We present the results of our update (to August 2020) in the sections below.

5.1 Domestic estimates

Table 4 presents the re-levered weekly equity beta estimates for a range of portfolios using ordinary least squares (OLS) regression.

Our comparator firms include:

- AGL Energy Limited (AGL)
- Alinta (AAN)
- APA Group (APA)
- AusNet Services (AST)
- DUET Group (DUE)
- Envestra Limited (ENV)
- GasNet (GAS)
- Hastings Diversified Utilities Fund (HDF)
- Spark Infrastructure (SKI)

There are eight portfolios (labelled P1 to P8) with differing constituent firms and differing time periods, as listed in the table.

6.2 Dividend growth model

The dividend growth model (DGM) uses analyst forecasts of dividend growth to estimate a forward looking MRP. We use a range of assumptions and input growth rates in order to arrive at a range of estimates.[16]

Table 9   Dividend growth model results with sensitivity analysis (2018 to 2020)

Sensitivity	Two stage model (2018)	Three stage model (2018)	Two stage model (2019)	Three stage model (2019)	Two stage model (2020)	Three stage model (2020)
Baseline	7.54	7.23	8.81	8.34	8.33	9.82
4.6% long-term growth rate						
Average over recent 2 months*						
unadjusted analysts' forecasts						
5.1% long-term growth rate	8.02	7.64	9.28	8.75	8.81	10.21
3.78% long-term growth rate	6.67	6.52	8.03	7.67	7.54	9.18
Average over recent 6 months*	7.45	7.18	8.48	7.76	8.83	9.72
Average over recent 12 months*	7.48	7.33	8.26	7.63	8.65	8.84
Analysts' forecast + 10%	8.12	7.78	9.36	8.85	8.80	10.41
Analysts' forecast - 10%	6.97	6.77	8.26	7.83	7.86	9.23
Combined - low	6.10	5.96	6.90	6.42	7.07	7.64
Combined - high	8.59	8.28	9.83	9.25	9.82	10.79

Comparator: Table 21 (page 269) of the 2018 explanatory statement.

Notes: All market risk premium estimates are based on an assumed theta of 0.65.
                   Combined - low is based on 3.78% growth, 12 month averaging, analysts' forecasts - 10%.
                   Combined - high is based on 5.1% growth, 2 month averaging, analysts' forecasts + 10%.
                   Recent averages (marked with *) are over the period to September 2018 (2018 instrument) or August 2019 (2019 update) or August 2020 (2020 update).

Source: Bloomberg, AER analysis.

6.3 MRP survey results

We note survey evidence comes from market practitioners who are asked what they expect the MRP to be in the Australian market. These surveys take on different forms and can vary in different ways, including questions asked, type of participants and number of participants. As such it is important to view each piece of evidence in the context it is presented. In the approach to date we have used the survey evidence to inform our MRP estimate. It informs

---

[16]   Our DGM estimation method is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 253–267.

us about investors' and market practitioners' expectations and/or what they apply in practice.[17]

Table 10 MRP survey results (2012 to 2020)

17   Our MRP survey results estimation method is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 270–271.

6.4 Conditioning variables

Conditioning variables are market data and indicators that provide information on the potential risk in the market.[18]

Dividend yields can be measured over time to give a signal of potential risk.

Figure 4 Dividend yields from ASX200 (April 2000 to August 2020)

Comparator: Figure 25 (page 273) of the 2018 explanatory statement.

Notes: Long run average taken from the start of the data series in 2000.

Source: AER analysis; sourced via Bloomberg code AS51.

The ASX200 volatility index (VIX) uses year ahead option prices to arrive at a measure of market volatility over time.

---

[18] Our use of conditioning variables is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 237–239, 272–274.

**Figure 5 Volatility index ASX200 (January 1997 to August 2020)**

Credit spreads from state government debt can indicate risk in the market.

Figure 6 Credit spreads from state government debt (January 2000 to August 2020)

7 Return on debt

7.1 Benchmark credit rating

Table 12 presents the median credit rating over time.[19]

Table 11 Median credit rating (2010 to 2020)

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
Industry Median	BBB+	BBB	BBB	BBB+	BBB+	BBB+	BBB+	BBB+	BBB+	BBB+	BBB+

Comparator: Table 25 (page 284) of the 2018 explanatory statement.

Source: Bloomberg, Standard & Poor's, Moody's. All other data is the same as published with the explanatory statement.

7.2 Return on debt from third party yield curves

Figure 7 presents the 'on-the-day' regulated return on debt calculated under the 2018 instrument, which uses a weighted average of BBB-rated and A-rated yield curves sourced from RBA, Bloomberg and Thomson Reuters.[20]

Figure 7 Third party yield curve time series (January 2014 to August 2020)

Source: Bloomberg, RBA, Thomson Reuters, AER analysis.

---

[19]   Our benchmark credit rating estimation method is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 284–289.

[20]   Our return on debt estimation method is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 276–376 (choice of third party providers is discussed on pp. 291–294). We have not reported the yield curves by individual provider because this data is proprietary.

The return on debt presented in Figure 7 is the on-the-day rate. As noted in section 2, energy networks are in the process of transitioning from an on-the-day approach to a trailing average portfolio that reflects a rolling ten year window of the historical return on debt.

Table 12 presents an indicative trailing portfolio return on debt for a regulated network that commenced the transition in 2015. In that year, the portfolio was set using the on-the-day rate (the annual estimate). In each subsequent year, the most recent annual estimate is added to the portfolio with 10 per cent weight and the weight on the first year decreases by 10 per cent.

Table 12 Indicative trailing average portfolio return on debt (2015 to 2020)

Year	Annual estimate	Trailing average portfolio	Portfolio composition (weight x return on debt year)
2015	4.92%*	4.92%	100% x 2015
2016	4.15%*	4.85%	90% x 2015, 10% 2016
2017	4.45%*	4.80%	80% x 2015, 10% x 2016, 10% x 2017
2018	4.42%*	4.75%	70% x 2015, 10% x 2016, 10% x 2017, 10% x 2018
2019	2.69%	4.53%	60% x 2015, 10% x 2016, 10% x 2017, 10% x 2018, 10% x 2019
2020	2.40%	4.27%	50% x 2015, 10% x 2016, 10% x 2017, 10% x 2018, 10% x 2019, 10% x 2020

Notes: Indicative averaging periods were chosen in August each year. Calculations prior to 2019 (marked with *) use the return on debt calculation method specified in the 2013 rate of return guideline. The 2018 figure here (4.42%) differs from the 2018 figure in Table 1 (4.70%) because they reflect different calculation methods (2013 guideline vs 2018 instrument) and different averaging periods (August 2018 vs November 2018).

Source: Bloomberg, RBA, Thomson Reuters, AER analysis.

7.3 Energy infrastructure credit spread index

The energy infrastructure credit spread index (EICSI) was developed by Chairmont during the 2018 review, using data on actual debt costs collected from regulated networks.[21] It reports a rolling 12-month historical average of all new debt instruments issued by privately owned energy networks.[22] The primary EICSI metric is the spread over the swap rate (broadly equivalent to the debt risk premium), but the EICSI dataset is also used to report average debt term and credit rating. It was used as a sense check on our proposed regulated return on debt approach.[23]

Figure 8 to Figure 10 present the updated EICSI with additional information on the average term to maturity of actual debt issuance by regulated networks. The average term is reported on a rolling 12 month window based on new debt issued (green squares). For comparison purposes, the spread on the AER's regulated return on debt is also presented (orange line).

---

[21]   Chairmont, *Aggregation of return on debt data*, 28 April 2018.
[22]   See AER, *Discussion paper, Estimating the allowed return on debt*, May 2018, pp. 27–35.

[23]   Our use of the EICSI is described in AER, *Draft rate of return instrument, Explanatory statement*, December 2018, pp. 451–459; and AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 299–300.

The base analysis uses the same approach used by Chairmont in its 2018 report and considered in the 2018 review.

Figure 8 displays the unweighted EICSI, updated where possible with the most recent actual cost of debt information.[24]

Figure 8 Relating Debt Term to Spread Difference (January 2014 to June 2020)

Energy Infrastructure Credit Spread Index (unweighted)
versus AER A/BBB 10-year rolling 12 months

— Industry Index (unweighted) — AER History ▪ Average Term (RHS)

Comparator: Graph 3 (page 10) of the 2018 Chairmont report
Notes: Spread is reported in basis points above the variable 3-month bank bill swap rate.

Source: AER analysis; Chairmont, *Aggregation of return on debt data*, 28 April 2018.

Figure 9 displays the EICSI reweighted by tenor to account for the difference in issuing long term debt compared to short term debt. That means the spread of longer term debt in the rolling data window (12 months) is given more weight than the spread of shorter term debt.

---

24   We collected actual debt costs from private-sector regulated networks on a voluntary basis in September-October 2019 and September-October 2020.

Figure 9 Comparing the EICSI weighted by tenor against the bank bill swap rate (BBSW) (January 2014 to June 2020)

Energy Infrastructure Credit Spread Index (weighted by Tenor)
versus AER A/BBB 10-year rolling 12 months

Industry Index (weighted) — AER History — Industry Index (unweighted) — Average Term (RHS)
Notes: Spread is reported in basis points above the variable 3-month bank bill swap rate.

Source: AER analysis; Chairmont, *Aggregation of debt data for portfolio term to maturity*, 28 June 2019.

Figure 10 presents the EICSI recalculated as a spread over the risk free rate (from 10 year Commonwealth Government Securities) instead of the bank bill swap rate (BBSW).

Figure 10   Comparing the EICSI weighted by tenor against the risk free rate (January 2014 to June 2020)

Energy Infrastructure Credit Spread Index (weighted by Tenor)
versus AER A/BBB 10-year rolling 12 months over AER risk free rate

Industry Index — AER History — Unweighted Industry Index — Average Term (RHS)

Source: AER analysis; Chairmont, *Aggregation of debt data for portfolio term to maturity*, 28 June 2019.
7.4 Debt term to maturity

The average term shown as green dots in Figure 8 is the *simple* average of all issuance in the 12 month data window. Figure 11 shows a graphical representation of the weighted average term to maturity at issuance (WATMI) for the period 2013-2020. WATMI is dependent on three parameters:

- Term to Maturity;

- Face value of issuance; and

- Number of debt issuances.

To obtain the industry WATMI, the drawdown sensitivity is taken as 100% (i.e. all debt instruments are fully drawn) and the term of each issuance is weighted by its face value. Debt is included in the WATMI from issuance until its maturity date. This analysis uses the same approach used by Chairmont in its 2019 report.
Figure 11   WATMI and number of debt issuances (January 2013 to June 2020)

Source: AER analysis; Chairmont, *Aggregation of debt data for portfolio term to maturity*, 28 June 2019.

Figure 12 is a comparison of WATMI at different drawdown sensitivities on a month-to-month basis. Scenarios 1, 2 and 3 represent drawdowns of 0%, 50% and 100% respectively.

Figure 12   WATMI drawdown scenarios (January 2013 to June 2020)

Source: AER analysis; Chairmont, *Aggregation of debt data for portfolio term to maturity*, 28 June 2019.

8 Return on equity cross check

8.1 Equity risk premium versus debt risk premium

We compare our equity risk premium (ERP) and debt risk premium (DRP).[25] This figure compares on-the-day ERP against the on-the-day DRP, not a trailing average portfolio.

Figure 13   Comparison of ERP and DRP (January 2013 to August 2020)

Comparator: Figure 6 (page 111) of the 2018 explanatory statement.

Source: AER analysis; Bloomberg; Thomson Reuters; RBA.

---

[25]   Our comparison of ERP and DRP is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 110–113.

9 Value of imputation credits

9.1 Utilisation rate from equity ownership

A component of our estimate of the value of imputation credits is the utilisation rate. This is the utilisation value to investors in the market per dollar of imputation credits distributed. In the 2018 review our estimate of the utilisation rate was informed by the equity ownership approach which uses data from the Australian Bureau of Statistics (ABS) to identify the proportion of equity in Australian firms held by domestic owners (rather than foreign investors).[26] Table 13 shows the utilisation rates with updated data.

Table 13 Utilisation rates from the equity ownership approach (2000 to 2020)

	2018 review (2000–2018)	2019 update (2000–2019)	2020 update (2000–2020)
Range of annual results	0.612–0.697	0.606–0.697	0.606–0.697
Most recent point estimate	0.638	0.643	0.639
Average over last five years	0.646	0.651	0.649
Average over last ten years	0.643	0.658	0.646

Comparator: Page 366 of the December 2018 explanatory statement.

Notes: ABS data commences in September 2000 and runs to June 2018 (2018 review), June 2019 (2019 update) and June 2020 (2020 update). We have recalculated the 2019 update figures using the latest ABS data revision.

Source: AER analysis; ABS statistical release series 5232 available at https://www.abs.gov.au/AUSSTATS.

---

[26] Our use of equity ownership to estimate the utilisation rate is described in AER, *Rate of return instrument, Explanatory statement*, December 2018, pp. 311–313, 359–366.
