# Economic Benchmarking RIN Basis of Preparation 2014

## Overview

United Energy is required to prepare a Basis of Preparation document (this document) which must, for all information:

- a) demonstrate how the information provided is consistent with the requirements of this Notice;
- b) explain the source from which United Energy obtained the information provided;
- c) explain the methodology United Energy applied to provide the required information, including any assumptions United Energy made;
- d) explain, in circumstances where United Energy cannot provide input for a Variable using Actual Information and therefore must provide input using Estimated Information:
  - 1) why an estimate was required, including why it was not possible for United Energy to use Actual Financial Information or Actual Non-financial Information (as the case may be, depending on the Variable);
  - 2) the basis for the estimate, including the approach used, assumptions made and reasons why the estimate is United Energy's best estimate, given the information sought in this Notice.

In accordance with the requirements above, this appendix provides details to support the information provided by United Energy in the Microsoft Excel workbooks titled:

- *'United Energy Economic Benchmarking RIN 2014 – Consolidated'*
- *'United Energy Economic Benchmarking RIN 2014 – Actual'*
- *'United Energy Economic Benchmarking RIN 2014 – Estimated'*

To satisfy the requirements of the Notice, the following information has been provided for each RIN table:

- assessment of data quality;
- data source;
- classification as actual or estimated information, including appropriate justification if estimated;
- methodology and assumptions adopted to prepare the information; and
- any additional comments to assist users of the information to understand the basis of preparation.

The table below outlines the classifications used to assess data quality.

**Table 1: Data quality and classifications**

Colour coding	Availability of data from NSP's Primary System	Assumptions / methodology
<b>Green</b>	Available and verifiable	Simple – no additional work or minor work around (e.g. data sourced from a secondary system)
<b>Light green</b>	Available with some gaps	Moderate – estimate based on statistically significant sample size
<b>Yellow</b>	Little or no data available	Complex – estimate based on formula, standard parameters or other source

Colour coding	Availability of data from NSP's Primary System	Assumptions / methodology
Pink	Little or no data available	Subjective – based on significant estimates, judgements and assumptions
Black	N/A	Not applicable to relevant NSP

The table below provides the AER definitions for actual and estimated information.

**Table 2: Definitions – ‘Actual and ‘estimated’**

Term	Table Heading
<b>Actual information</b>	<p>Information presented in response to the Notice whose presentation is Materially dependent on information recorded in United Energy's historical accounting records or other records used in the normal course of business, and whose presentation for the purposes of the Notice is not contingent on judgments and assumptions for which there are valid alternatives, which could lead to a Materially different presentation in the response to the Notice.</p> <p>'Accounting records' include trial balances, the general ledger, subsidiary accounting ledgers, journal entries and documentation to support journal entries. Actual financial information may include accounting estimates, such as accruals and provisions, and any adjustments made to the accounting records to populate United Energy's regulatory accounts and responses to the Notice. 'Records used in the normal course of business', for the purposes of non-financial information, includes asset registers, geographical information systems, outage analysis systems, and so on.</p>
<b>Estimated information</b>	<p>Information presented in response to the Notice whose presentation is not Materially dependent on information recorded in United Energy's historical accounting records or other records used in the normal course of business, and whose presentation for the purposes of the Notice is contingent on judgments and assumptions for which there are valid alternatives, which could lead to a Materially different presentation in the response to the Notice.</p>

The estimated information is produced using the methodology detailed below. This methodology represents United Energy's best estimate as applied over prior reporting periods and is sourced from United Energy's information systems, audited information (where applicable), internal management reports and subject matter expert professional judgement based on the nature of United Energy's operations. United Energy is unable to provide information with greater accuracy than that provided in its response.

Where estimates have been provided, United Energy is currently considering the feasibility of improvement opportunities to allow actual information to be provided in the future.

## Detailed basis of preparation

The following tables outline the basis of preparation of the information provided in all Microsoft Excel Workbooks outlined in the Overview section.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
3.1	Revenue	3.1.1	Revenue Grouping By Chargeable Quantity  DREV0101 - Revenue from Fixed Customer Charges		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum fixed revenue components for all tariffs (i.e. Cmp = 'FXD'). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		A high percentage of actual billed data has been used.
			DREV0102 - Revenue from Energy Delivery charges where time of use is not a determinant		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum revenue components of single rate tariffs (i.e. S1, M1, L1, S1WET). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		A high percentage of actual billed data has been used.
			DREV0103 - Revenue from On-Peak Energy Delivery charges		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum peak tariff revenue components (excluding S1, M1, L1, S1WET). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		A high percentage of actual billed data has been used.  The definition of peak times can vary across different tariffs.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
			DREV0104 - Revenue from Shoulder period Energy Delivery Charges		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum shoulder revenue components (i.e. Cmp = 'SHD'). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		A high percentage of actual billed data has been used.  The definition of shoulder times can vary across different tariffs.
			DREV0105 - Revenue from Off-Peak Energy Delivery charges (excluding hot water and other DED)		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum off-peak revenue components (excluding controlled load and unmetered energy). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		A high percentage of actual billed data has been used.  The definition of off-peak times can vary across different tariffs.
			DREV0106 - Revenue from controlled load customer charges		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum controlled load revenue (i.e. Tariff = 'DED'). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		
			DREV0107 - Revenue from unmetered supplies		F	Based on reported monthly energy. CIS/SAP Billing System and	Actual		Sum unmetered revenue (i.e. Tariff = 'UNM'). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors		A high percentage of actual billed data has been used.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
						accrual data extracts			- Inter DNSP energy flows - Embedded generation - Known billing issues		
			DREV0109 - Revenue from Measured Maximum Demand charges		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum revenue of maximum demand related charges (i.e. Cmp = 'DMNRLN', 'DMNSMR') For accrued components scaling and adjustments may be made based on; - Known billing issues		A high percentage of actual billed data has been used.
			DREV0110 - Revenue from metering charges		F	SAP Financial accounts	Actual		Extracted from summary sheet 'Alternative Control Services and Other Services' of the final RIN reported revenues for 2014. Includes the sum of the following; - Meter investigation - Special meter reading - Remote meter re-configuration		Alternative control services
			DREV0111 - Revenue from connection charges		F	SAP Financial accounts	Actual		Extracted from summary sheet 'Alternative Control Services and Other Services' of the final RIN reported revenues for 2014. Includes the sum of the following; - De-energisation of existing connections - Energisation of existing connections - Routine connections - customers below 100 amps - Temporary supply services - Remote de-energisation - Remote re-energisation - Supply abolishment		Alternative control services

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
									- Elective underground service - Routine connections, for customers > 100amps		
			DREV0112 - Revenue from public lighting charges		F	SAP Financial accounts	Actual		Extracted from summary sheet 'Alternative Control Services and Other Services' of the final RIN reported revenues for 2014.		Alternative control services
			DREV0113 - Revenue from other Sources		Financial	SAP Financial accounts	Actual		Extracted from summary sheet 'Alternative Control Services and Other Services' of the final RIN reported revenues for 2014. Includes the sum of the following: - Wasted attendance - Service truck visits - Reserve feeder - Emergency recoverable works - Elective underground service - Covering of low voltage mains for safety reasons - After hours truck by appointment Also includes negotiated services taken from Tab 1a. Income from the 2014 financial RIN.		Alternative control services
			DREV01 - Total revenue by chargeable quantity		F	Refer to DREV0101 to DREV0109	Actual		Sum of DREV0101 to DREV0109.		A high percentage of actual billed data has been used.  This only contains revenue from standard control services.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
		3.1.2	Revenue Grouping by Customer Type or Class  DREV0201 - Revenue from residential Customers		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum up revenue components for residential tariffs. (i.e. DED, S1, S1WET, S2, TOD, TOD9, TODFLEX). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		A high percentage of actual billed data has been used.
			DREV0202 - Revenue from non-residential customers not on demand tariffs		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum up revenue components for the following non-residential tariffs. (L1, L2, M1, M25, M27) For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		
			DREV0203 - Revenue from non-residential low voltage demand tariff customers		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum up revenue components for the following LV demand tariffs. (KW-TOU, KW-TOU-H, L2-KVA, L2-KVA-H, TOU). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
			DREV0204 - Revenue from non-residential high voltage demand tariff customers		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum up revenue components for the following HV demand tariffs. (HV-KVA, HV-KVA-H, ST22-KVA). For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		
			DREV0205 - Revenue from unmetered supplies		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum up revenue components for UNM tariff. For accrued components scaling and adjustments may be made based on; - Boundary load metered energy and loss factors - Inter DNSP energy flows - Embedded generation - Known billing issues		
			DREV02 - Total revenue by customer class		F	Based on reported monthly energy. CIS/SAP Billing System and accrual data extracts	Actual		Sum of DREV0201 to DREV0206.		
			DREV0206 - Revenue from Other Customers (Standard Control Services)		Financial	SAP Financial accounts	Actual		As per DREV0113 in Standard Control Services column. (Tab 3.1 Revenue of EB RIN).		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
3.2			DREV0206 - Revenue from Other Customers (Alternative Control Services)		Financial	SAP Financial accounts	Actual		As per DREV01 in Alternative Control Services column. (Tab 3.1 Revenue of EB RIN).		
		3.1.3	Revenue (Penalties) allowed (deducted) through incentive schemes DREV0302 - STPIS		F	Based on Annual RIN reported revenue for 2014 and S Factor performance as supplied by Network Management.	Actual		Multiply the annual RIN report revenue by the applicable S factor for the year.		
			DREV0303 - F-Factor		F	SAP Financial accounts	Actual		This is taken from the summary sheet of the final RIN reported revenues for 2014 which would have been derived from; - Sum transactions for SAP pass through charges account		
			DREV0304 - S-Factor True up		F	UED PTRM opex allowance	Actual		As per AER determination		
			DREV03 - Total revenue of incentive schemes		F	Refer to DREV0301 to DREV0305.	Actual		Sum of DREV0301 to DREV0305.		
		<b>Opex</b>	3.2.1.1	Current Opex Categories and Cost Allocations							

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
		3.2.1.2 A	Historical OPEX Categories and Cost Allocations		F	Annual Financial RIN 2014 (SAP data)	Actual		Refer Schedule 6a of United Energy Annual RIN 2014: <ul style="list-style-type: none"> <li>• Routine</li> <li>• Condition based</li> <li>• Emergency</li> <li>• SCADA/Network Control</li> <li>• Other - SCS (a)</li> <li>• Metering RBPC</li> <li>• Public Lighting</li> <li>• Alternative Control - Other</li> <li>• Negotiated Services</li> </ul> Refer Schedule 8a of United Energy Annual RIN 2014: <ul style="list-style-type: none"> <li>• Network Operating Costs</li> <li>• Billing &amp; Revenue Collection</li> <li>• Advertising/Marketing</li> <li>• Customer Service</li> <li>• Regulatory</li> <li>• Regulatory Reset</li> <li>• IT</li> <li>• Licence fee</li> <li>• GSL payments</li> <li>• Non-network alternatives costs</li> <li>• Debt raising costs</li> <li>• Other - Standard Control Services (a,b)</li> </ul>		
		3.2.1.2 B	Historical OPEX Categories and Cost Allocations								
		3.2.1.2 C	Historical OPEX Categories and Cost Allocations								

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
		3.2.2.1	OPEX Consistency - Current Cost Allocation Approach			OPEX for network services – Refer to Table 3.2.1.2A  OPEX for metering – Tab 14 Annual Financial RIN 2014	Actual		<b>OPEX for network services</b> All maintenance SCS OPEX is related to network services (DOPEX 118 to 126) and has been classified accordingly. ACS classifications have been allocated to appropriate categories based on descriptions  <b>OPEX for metering, OPEX for connection services, OPEX for public lighting</b> ACS classifications have been allocated to appropriate categories based on cost descriptions		
		3.2.2.2	OPEX Consistency - Historical Cost Allocation Approaches			OPEX for network services – Refer to Table 3.2.1.2A  OPEX for metering – Tab 14 Annual Financial RIN 2014	Actual		<b>OPEX for network services</b> All maintenance SCS OPEX is related to network services (DOPEX 118 to 126) and has been classified accordingly. ACS classifications have been allocated to appropriate categories based on descriptions  <b>OPEX for metering, OPEX for connection services, OPEX for public lighting</b> ACS classifications have been allocated to appropriate categories based on cost descriptions		
		3.2.4	Opex for High Voltage Customers		F	SAP	Estimate	MVA installation for HV customers not known. Assumption that Maximum demand	1) Obtain Maximum demand from SAP billing info for all HV customers	Maximum demand is reflective of installed capacity per hv customer.	

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
								is reflective of installed capacity	2) Identify peak demand for each hv customer 3) Obtain total network opex costs Table 2.8 CA RIN 4) Obtain Installed Dist TX capacity from table 2.2.2 in CA RIN 5) Divide OPEX cost by sum of peak demand HV customers plus Installed Dist TX 6) Obtain cost per MVA 7) Multiply each HV customer installed capacity by cost per mva and sum totals 8) Divided the sum of step 7 by total asset to maintain per year. 9) Cost per year times the total number of HV customer and divided by 3.	OPEX cost per MVA can be averaged across the network and reflective of costs of HV customer installations.	
3.2.3	Provisions	3.2.3	Provisions		F	SAP Payroll	Actual		SAP data. Bonus paid and leave taken based on payroll reports. Bonus provision trued up to actual bonuses paid. Environmental obligation based on third party expert reports.		
			Additional Provisions - OPEX		F	SAP Payroll	Estimate	Additional opex provision for	Bonus amounts based on historical KPI achievement.		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
			Additional Provisions – CAPEX Additional Provisions - OPEX					outstanding claims payable.	Annual leave & LSL accruals based on payroll data provided. Additional Provisions – OPEX – Management estimate based on maximum BAU claims expected at any point in time. Endorsed by ARC.		
3.3	Assets (RAB)	3.3.1	Regulatory Asset Base Values		F	SAP	Actual		The data in this table is the sum of the RAB variables. <b>Network Services</b> UE has deducted the value of services from the standard control asset base as its basis of populating this template. This only affects asset classes: <ul style="list-style-type: none"> <li>• Overhead network &lt;33kv</li> <li>• Underground network &lt;33kv</li> </ul> The value of the services asset value has been determined on the basis as that described under standard control – refer Table 3.3.2. <b>Standard Control Services</b> This template has been completed based on Annual RIN data.		
		3.3.2	Asset Value Roll Forward		F	SAP United Energy RAB work book based on AER guidance	Actual / Estimate	As per AER requirements.	An insurance valuation report prepared by Ernst & Young (2011) itemises UE's asset to a detailed asset class level. The valuation percentages for this report are outlined below and have been used to prepare this data.		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments

		3.4.3	System demand 3.4.3.1 Annual MD at Zone sub Level - MW DOPSD0101 Non-coincident Summated Raw System Annual Peak Demand		NF	Load Forecast Spreadsheet.	Actual		Peak demands are recorded at a zone substation level in our SCADA system. The load forecast spreadsheet is updated to include this data. Summation of individual zone substation peak demand provides the requested data.	It should be noted that these demands exclude (i.e. assumed out of service) the embedded generation at Dandenong and Springvale South zone substations	Peak demands are recorded over a summer period which extends from November to March, so that it is possible for a peak demand for a particular calendar year to fall in the previous November or December.
			DOPSD0102 Non-coincident Summated Weather Adjusted System Annual Peak Demand 10% POE		NF	Load Forecast Spreadsheet.	Estimate	The 10% PoE forecast relies on temperature sensitivity information provided by the NIEIR forecast. This information is validated against historical data, an internal estimation procedure and bottom up estimation.	The 10% PoE forecast is generated from actual peak demand data and corrected for temperature. The correction of PoE for temperature is based on historical data, the scaling factor of Load with PoE is based on NIEIR estimates. Summation of individual zone substation peak demand provides the requested data.	It should be noted that these demands exclude (i.e. assumed out of service) the embedded generation at Dandenong and Springvale South zone substations	Peak demands are recorded over a summer period which extends from November to March, so that it is possible for a peak demand for a particular calendar year to fall in the previous November or December.
			DOPSD0103 Non-coincident Summated Weather Adjusted System Annual Peak Demand 50% POE		NF	Load Forecast Spreadsheet.	Estimate	The 50% PoE forecast relies on temperature sensitivity information provided by the NIEIR forecast. This information is validated against historical data, an internal estimation procedure and bottom up estimation.	The 50% POE maximum demand levels are calculated from the 10% POE by the application of correction factors for demand sensitivity with temperature and a temperature correction factor for substations in the Mornington peninsula.	It should be noted that these demands exclude (i.e. assumed out of service) the embedded generation at Dandenong and Springvale South zone substations	Peak demands are recorded over a summer period which extends from November to March, so that it is possible for a peak demand for a particular calendar year to fall in the previous November or December.
			DOPSD0104 Coincident Raw System Annual Peak Demand		NF	Load Forecast Spreadsheet.	Actual		Half hourly data at individual zone substations is extracted and summated for each year (summer period).	It should be noted that these demands exclude (i.e. assumed out of service) the embedded generation at Dandenong and	Peak demands are recorded over a summer period which extends from November to March, so that it is possible for a peak demand for a particular calendar year to

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
										Springvale South zone substations	fall in the previous November or December.
			DOPSD0105 Coincident Weather Adjusted System Annual Peak Demand 10% POE		NF	Load Forecast Spreadsheet.	Estimate	The 10% PoE forecast relies on temperature sensitivity information provided by the NIEIR forecast. This information is validated against historical data, an internal estimation procedure and bottom up estimation.	The ratio between weather corrected 10% POE non-coincident maximum demand in MW and the raw non-coincident maximum demand in MW at each zone substation is used to estimate the weather corrected 10% POE coincident maximum demand in MW.	The demand assumes the embedded generation at Dandenong and Springvale South Zone substation is included.	Peak demands are recorded over a summer period which extends from November to March, so that it is possible for a peak demand for a particular calendar year to fall in the previous November or December.
			DOPSD0106 Coincident Weather Adjusted System Annual Peak Demand 50% POE		NF	Load Forecast Spreadsheet.	Estimate	The 50% PoE forecast relies on temperature sensitivity information provided by the NIEIR forecast. This information is validated against historical data, an internal estimation procedure and bottom up estimation.	The ratio between weather corrected 50% POE non-coincident maximum demand in MW and the raw non-coincident maximum demand in MW at each zone substation is used to estimate the weather corrected 50% POE coincident maximum demand in MW.	It should be noted that these demands exclude (i.e. assumed out of service) the embedded generation at Dandenong and Springvale South zone substations	Peak demands are recorded over a summer period which extends from November to March, so that it is possible for a peak demand for a particular calendar year to fall in the previous November or December.
			3.4.3.2 Annual MD at Transmission Connection Point - MW DOPSD0107 Non-coincident Summated Raw System Annual Peak Demand		NF	Connection Asset Forecast	Actual		Non-coincident peak demands (MW & MVA) at individual terminal stations are calculated based on interval metering data. The UE numbers are reconciled with the AEMO values for accuracy during this process. Individual terminal station peak demands are summed to calculate the non-coincident raw system annual demand.	The demand assumes the embedded generation at Dandenong and Springvale South Zone substation is included.	AEMO allocates the power flows through a sub-transmission line to the DNSP to whom the physical assets belongs to. Therefore, in shared sub-transmission loops and shared zone substations, the actual UE demand deviates from the AEMO's assessment depending on the amount of cross border flows between adjacent DNSPs.

This information is validated against historical data, an internal estimation procedure and bottom up estimation.	The 50% POE scaling factor calculated based on the actual and weather corrected total UE demand is used to scale the non-coincident demand calculated under DOPSD0207 to estimate the 50% POE non-coincident weather adjusted system annual maximum demand.		
			DOPSD0210 Coincident Raw System Annual Peak Demand		NF	Load Forecast Spreadsheet	Estimate	The estimate is accurate to the extent that the system average power factor is accurate.	The coincident raw system annual maximum MW demand calculated under DOPSD10 is divided by the system average power factor calculated at non-coincident maximum demand to calculate the information for this cell.		It should be noted that these demands represent the total UE demand (adjusted for metered cross border flows) and exclude the embedded generation output at Dandenong and Springvale South zone substations.
			DOPSD0211 Coincident Weather Adjusted System Annual Peak Demand 10% POE		NF	Load Forecast Spreadsheet	Estimate	The estimate is accurate to the extent that the system average power factor is accurate.	The 10% POE coincident weather adjusted system annual maximum MW demand calculated under DOPSD11 is divided by the system average power factor calculated at non-coincident maximum demand to calculate the information in this cell.		It should be noted that these demands represent the total UE demand (adjusted for metered cross border flows) and exclude the embedded generation output at Dandenong and Springvale South zone substations.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
			DOPSD0212 Coincident Weather Adjusted System Annual Peak Demand 50% POE		NF	Load Forecast Spreadsheet	Estimate	The estimate is accurate to the extent that the system average power factor is accurate.	The 50% POE coincident weather adjusted system annual maximum MW demand calculated under DOPSD12 is divided by the system average power factor calculated at non-coincident maximum demand to calculate the information for this cell.		It should be noted that these demands represent the total UE demand (adjusted for metered cross border flows) and exclude the embedded generation output at Dandenong and Springvale South zone substations.
			3.4.3.5 Power factor Conversion between MVA and MW DOPSD0301 Average over whole network		NF	Calculated value	Estimate	The power factor at maximum demand is used as the average power factor. This is reasonable estimate as power factor does not vary materially and to calculate the average power factor would be very onerous.	The power factor conversion is a formula based factor.  Coincident Raw System Annual Maximum Demand - MW (DOPSD0110) divided by the Coincident Raw System Annual Maximum - MVA (DOPSDP210)		
			DOPSD0302 Average for LV		NF	Calculated value	Estimate	The power factor at maximum demand is used as the average power factor. This is reasonable estimate as power factor does not vary materially and to calculate the average power factor would be very onerous.	The summer peak kW and kVAr for all LV substations has been used to calculate the average power factor for low voltage distribution lines.	We have assumed that the LV distribution line power factors are similar to the respective LV distribution substation power factors.	SWER Line Loads have been removed from the calculation
			DOPSD0303 Average for 3.3kV								UE does not have any 3.3kV lines
			DOPSD0304 Average for 6.6kV		NF	Calculated from Load Forecast	Estimate	The power factor at maximum demand is used as the average	Peak demand for all 6.6kV feeder MW and MVAR values are totalled from		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
						Spreadsheet Peak Demand.		power factor. This is reasonable estimate as power factor does not very materially and to calculate the average power factor would be very onerous.	actual data in the load forecast spreadsheet and are used to calculate the power factor.		
			DOPSD0305 Average for 7.6kV								UE does not have any 7.6kV lines
			DOPSD0306 Average for 11kV		NF	Calculated from Load Forecast Spreadsheet Peak Demand.	Estimate	The power factor at maximum demand is used as the average power factor. This is reasonable estimate as power factor does not very materially and to calculate the average power factor would be very onerous.	Peak demand for all 11kV feeder MW and MVAR values are totalled from actual data in the load forecast spreadsheet and are used to calculate the power factor.		
			DOPSD0307 Average for SWER		NF	Calculated from Load Forecast Spreadsheet Peak Demand.	Estimate		Summer peak demand for all SWER substation kW and kVAR values are totalled from actual data in the distribution substation data spreadsheet and are used to calculate the power factor.	Assumes that the distribution line power factors are similar to the SWER distribution Substation Power Factor.	
			DOPSD0308 Average for 22kV		NF	Calculated from Load Forecast Spreadsheet Peak Demand.	Estimate	The power factor at maximum demand is used as the average power factor. This is reasonable estimate as power factor does not very materially and to calculate the average power factor	Peak demand for all 22kV feeder MW and MVAR values are totalled from actual data in the load forecast spreadsheet and are used to calculate the power factor.		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
								would be very onerous.			
			DOPSD0309 Average for 66kV		NF	Calculated from Load Forecast Spreadsheet Peak Demand.	Estimate	The power factor at maximum demand is used as the average power factor. This is reasonable estimate as power factor does not vary materially and to calculate the average power factor would be very onerous.	The data is calculated from a formula using the measures non-coincident power flow into the zone substation excluding zone substation transformation which is DOPSD0101 divided by DOPSD0201.		
			DOPSD0310 Average for 110kV		NF						UE does not have any 110kV, 132kV or 220kV lines
			DOPSD0311 Average for 132kV/ 220kV		NF						UE does not have any 110kV, 132kV or 220kV lines
			3.4.3.6 Demand supplied (for customers charged on this basis) – MW measure  DOPSD0401 - Summated Chargeable Contracted Maximum Demand		NF						Not applicable for UE

		3.6.2	Energy Not Supplied DSQ0201 Planned		NF	Reliability data was taken from the non-financial RIN. The demand is that average annual feeder demand calculated from meter data.	Estimate	The calculation uses average demand rather than actual demand so is deemed to be an estimate. The estimate is the best available.	The energy not supplied was calculated based on annual reliability data for planned outages. Energy not supplied = average customer demand X no of customers interrupted X duration of interruption.		
			DSQ0202 Unplanned		NF	Reliability data was taken from the non-financial RIN. The demand is that average annual feeder demand calculated from meter data.	Estimate	The calculation uses average demand rather than actual demand so is deemed to be an estimate. The estimate is the best available.	The energy not supplied was calculated based on annual reliability data for unplanned outages. Energy not supplied = average customer demand X no of customers interrupted X duration of interruption.		
			DSQ02 Total		NF	Reliability data was taken from the non-financial RIN. The demand is that average annual feeder demand calculated from meter data.	Estimate	This is a calculated value made up of the sum of two estimated values.	This is the sum of DSQ0201 + DSQ0202.		
		3.6.3	System Losses DSQ03 System Losses		NF	Distribution Management Database	Actual		Total UE distribution losses are annually calculated as part of the Distribution Loss Factor (DLF) reporting. The corresponding system losses percentage is		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
3.7									calculated as network loss/total energy procured.		
		3.6.4	Capacity Utilisation DSQ04 Overall Utilisation		NF	Distribution Management Database	Actual		This is the percentage of non-coincident summated raw system annual maximum demand in MVA (DOPSD0201) divided by the summation of total installed zone substation transformer capacity (DPA0604) at all the zone substations.		
	<b>Operating Environment</b>	3.7	Operating Environmental factors General						UE has produced a number of documents which contain instructions on how the data required for the RIN category is to be obtained and populated. These documents include detailed methodologies to provide both actual and estimated data. The Basis of Preparation against each relevant RIN category is a summary of the methodology detailed within these UE produced documents. For this particular RIN, document UE PR 0085 was referenced and can be provided upon request.		It should be noted that UE does not record data under 'Urban' and 'Rural' categories. All Low Bushfire Risk Areas (LBRAs) are considered to be equivalent to 'Urban' and all High Bushfire Risk Areas (HBRAs) are considered to be equivalent to 'Rural'.
		3.7.1	Density Factors DOEF0101 Customer Density		NF	Calculated	Actual		The cell is calculated from using data from other categories. Customer Density = Total Customer Numbers		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
									(DOPCN01) / Route Line Length (DOEF0301)		
			DOEF0102 Energy Density		NF	Calculated	Actual		The cell is calculated from using data from other categories. Energy Density = Total Energy Delivered (DOPED01) X 1000 / Total Customer Numbers (DOPCN01)		
			DOEF0101 Demand Density		NF	Calculated	Actual		The cell is calculated from using data from other categories. Demand Density = Annual Maximum Demand X 1000 (DOPSD0201) / Total Customer Numbers (DOPCN01)		
		3.7.2	Terrain Factors DOEF0201 Rural Proportion		NF	GIS Database	Actual		The requested information is held within UE's Geographical Information System (GIS) as feeder data includes a rural/urban attribute. The sum of span lengths is divided by 1000 to convert to kilometres, divided by the Route Line Length (DOEF0301) and multiplied by 100 to give the Rural Proportion as a percentage.		
		3.7.2	Terrain Factors DOEF0202 Urban/CBD vegetation Spans		NF	Vegetation Management System Report Electric Line Clearance	Estimate	Urban/Rural split is estimated assuming HBRA is rural, LBRA is urban.	A Vegetation Management System (VMS) records the number of spans as High Bushfire Risk Area (HBRA) or Low Bushfire Risk Area (LBRA), not Urban or Rural.		It has been assumed that any spans reported as LBRA will be equivalent to Urban spans.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
						Management Plan					
			DOEF0203 Rural vegetation Spans		NF	Vegetation Management System Report Electric Line Clearance Management Plan	Estimate	Rural Spans are assumed to be HBRA spans.	A Vegetation Management System (VMS) records the number of spans as High Bushfire Risk Area (HBRA) or Low Bushfire Risk Area (LBRA), not Urban or Rural.		It has been assumed that any spans within the VMS reported as HBRA will be equivalent to Rural spans.
			DOEF0204 Total Vegetation Maintenance Spans		NF	Calculated	Estimate	Rural Spans are assumed to be HBRA spans.	A Vegetation Management System (VMS) records the number of spans as High Bushfire Risk Area (HBRA) or Low Bushfire Risk Area (LBRA), not Urban or Rural. The total Vegetation maintenance spans is the sum of HBRA and LBRA spans.		
			DOEF0205 Total spans		NF	GIS Database	Actual		The requested information is held within UE's Geographical Information System (GIS). The Total number of spans variable is calculated as the sum of all spans within the UE network.		
			DOEF0206 Urban and CBD vegetation span cycle		NF	Vegetation Management System Report Electric Line Clearance	Actual		The average vegetation span cycle has been calculated from the actual total number of LBRA spans maintained over the last two years (2013 & 2014). Factor of Spans Inspected to Total Spans = (Urban		Nominal cycle is 2 years per the Electric line clearance plan.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
						Management Plan			and CBD Vegetation Maintenance Spans (2013) + Urban and CBD Vegetation Maintenance Spans (2014)) / (Total Number of LBRA Spans) Average Urban and CBD Vegetation Maintenance Span Cycle = 2 / (Factor of Spans Inspected to Total Spans)		
			DOEF0207 Rural vegetation span cycle		NF	Vegetation Management System Report Electric Line Clearance Management Plan	Estimate	This number is estimated because the rural area is estimated.	The average vegetation span cycle has been calculated from the actual total number of HBRA spans maintained over the last two years (2013 & 2014). Factor of Spans Inspected to Total Spans = (Rural Vegetation Maintenance Spans (2013) + Rural Vegetation Maintenance Spans (2014)) / (Total Number of HBRA Spans) Average Urban and CBD Vegetation Maintenance Span Cycle = 2 / (Factor of Spans Inspected to Total Spans)		The calculation will provide the expected cycle time required to complete all spans at the current rate of span maintenance.
			DOEF0208 Average trees per CBD & urban span		NF	Calculated	Estimate	The data used was commissioned in 1999 with no further information available.	A Vegetation Management Review was commissioned in 1999 which concluded that approximately 564,200 trees were within the immediate vicinity of the UE overhead distribution		The calculation assumes an even distribution of trees along the entire urban network length.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
									<p>network; UE is responsible for approximately 339,000 trees, with the remaining 224,700 maintained by councils.</p> <p>The review also determined that of the 564,200 trees, approximately 24% (135,408) of trees were in a HBRA (Rural) and approximately 76% (428,792) of trees were in a LBRA (Urban).</p> <p>As UE does not record number of trees per span, the average number of trees per urban and CBD vegetation maintenance span is calculated by taking the average number of trees per span across the urban and CBD network.</p> <p>Average Number of Trees per Urban and CBD Vegetation Maintenance Span= (Number of Trees in LBRA)/(Number of LBRA Spans)</p>		
			DOEF0209 Average trees per rural span		NF	Calculated	Estimate	The data used was commissioned in 1999 with no further information available.	<p>A Vegetation Management Review was commissioned in 1999 which concluded that approximately 564,200 trees were within the immediate vicinity of the UE overhead distribution network; UE is responsible for approximately 339,000 trees, with the remaining 224,700 maintained by councils.</p> <p>The review also determined</p>		The calculation assumes an even distribution of trees along the entire rural network length.

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
									<p>that of the 564,200 trees, approximately 24% (135,408) of trees were in a HBRA (Rural) and approximately 76% (428,792) of trees were in a LBRA (Urban). As UE does not record number of trees per span, the average number of trees per rural vegetation maintenance span is calculated by taking the average number of trees per span across the rural network.</p> <p>Average Number of Trees per Rural Vegetation Maintenance Span= (Number of Trees in HBRA)/(Number of HBRA Spans)</p>		
			DOEF0210 Average defects per CBD & urban span		NF	Calculated	Estimate	UE recording processes do not record the number of defects cleared compared to the number of trees cleared. UE can only give a best estimate for this data variable. In the Urban and CBD areas, UE estimates that 25% of trees per maintenance span breach the regulatory clearance requirements and require maintenance.	The calculation for Average Number of Defects per Urban and CBD Vegetation Maintenance Span becomes the Average Number of Trees per Urban and CBD Vegetation Maintenance Span multiplied by 0.25.		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
			DOEF0211 Average defects per rural span		NF	Calculated	Estimate	UE recording processes do not record the number of defects cleared compared to the number of trees cleared. UE can only give a best estimate for this data variable. UE undertakes an annual pre-summer inspection in the Rural (HBRA) areas. UE estimates that 20% of trees per maintenance span breach the regulatory clearance requirements and require maintenance.	The calculation for Average Number of Defects per Rural Vegetation Maintenance Span becomes the Average Number of Trees per Rural Vegetation Maintenance Span multiplied by 0.20.		
			DOEF0212 Tropical Proportion								UE does not have any tropical portion of land within its distribution area.
			DOEF0213 standard Vehicle access		NF	Calculated	Estimate	UE does not maintain detailed records of the network distance accessible by standard vehicles (2X2). As an estimate, it is expected that only 1% of the network is inaccessible by standard vehicles.	Considering the AER definition provided for this variable, which is "Distribution route Line Length that does not have Standard Vehicle Access", the standard vehicle access distance becomes:  Standard Vehicle Access Distance (km) = Total Network Lengthx1%		
			DOEF0214 Bushfire risk		NF	GIS Database	Estimate	Actual information is unavailable. This data is estimated based on	The requested information is held within UE's Geographical Information System (GIS). To access		

Tab	Table Name	Table	Table Title	Data quality	Fin / Non-fin	Data source	Actual / Estimate	Justification (if estimated)	Methodology (Actual & Estimated)	Assumptions (Actual & Estimated)	Additional Comments
3.7.4								the best available information.	this information UE have purpose built reports. The AM/FM reports webpage is a portal to obtain this asset data. The Bushfire Risk variable is calculated as the sum of spans that are defined as "True" within the Bushfire Zone.		
		3.7.3	Service area factors DOEF0301 Route line length.		NF	GIS Database	Actual		The requested information is held within UE's Geographical Information System (GIS). To access this information UE have purpose built reports. The AM/FM reports webpage is a portal to obtain this asset data. The Route Line Length variable is calculated as the sum of all UE network span lengths.		
	<b>Weather Stations</b>	3.7.4	Weather Stations		NF	Bureau of Meteorology	Actual		Presently there are three weather stations owned by the Bureau of Meteorology located in the UE service area. UE Service area and Terminal station maximum demand forecasts are based on PoE's for Melbourne Regional Office Weather station.
