# WEEKLY MARKET ANALYSIS

16 - 22 August 2009

#### **Summary**

Average spot prices ranged from \$19/MWh in Tasmania to \$25/MWh in Queensland.

#### **Spot market prices**

Figure 1 sets out the volume weighted average prices for the week 16 August to 22 August and the financial year to date across the National Electricity Market (NEM). It compares these prices with price outcomes from the previous week and year to date respectively.

Figure 1: Volume weighted average spot price by region (\$/MWh)

	Qld	NSW	VIC	SA	Tas
Average price for 16 – 22 August	25	23	22	22	19
% change from previous week*	4	-8	-9	-15	-16
09/10 financial YTD	27	30	26	27	25
% change from 08/09 financial YTD**	-32	-31	-43	-42	-40

<sup>\*</sup>The percentage change between last week's average spot price and the average price for the previous week.

Longer term market trends are attached in Appendix A.

Figure 2 shows the seven day rolling cumulative price for each region together with the Cumulative Price Threshold (CPT) (and the equivalent seven day time weighted average price).

Figure 2: Seven day rolling cumulative price, average price and CPT

<sup>\*</sup>In January 2009 the cumulative price in South Australia reached \$460 000 and in Victoria reached \$280 000.

<sup>\*\*</sup>The percentage change between the average spot price for the current financial year to date and the average spot price over the similar period for the previous financial year.

#### **Financial markets**

Figures 3 to 10 show futures contract<sup>1</sup> prices traded on the Sydney Futures Exchange (SFE) as at close of trade on Monday 24 August. Figure 3 shows the base futures contract prices for the next three calendar years, and the three year average. Also shown are percentage changes compared to the previous week.

Figure 3: Base calendar year futures contract prices (\$/MWh)

	QI	_D	NS	SW	V	IC	S	SA
Calendar Year 2010	40	0%	42*	0%	43	0%	49	1%
Calendar Year 2011	42*	0%	46*	1%	47	0%	59	0%
Calendar Year 2012	53*	-2%	59	0%	60	-1%	69	0%
Three year average	45	-1%	49	0%	50	0%	59	0%

Note: there were no trades in these products.

Figure 5 shows the weekly trading volumes for base, peak and cap contracts. The date represents the end of the trading week.

Figure 5: Number of exchange traded contracts per week

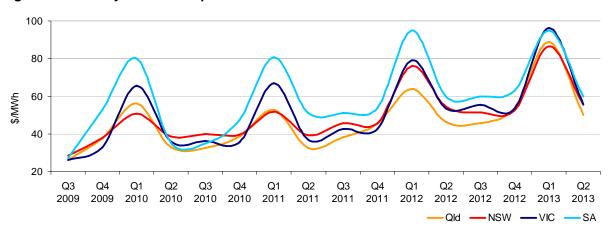

Source: d-cyphaTrade www.d-cyphatrade.com.au

Figure 6 shows the prices for base contracts for each quarter for the next four financial years.

Futures contracts on the SFE are listed by d-cyphaTrade (<a href="www.d-cyphatrade.com.au">www.d-cyphatrade.com.au</a>). A futures contract is typically for one MW of electrical energy per hour based on a fixed load profile. A base load profile is defined as the base load period from midnight to midnight Monday to Sunday over the duration of the contract quarter. A peak load profile is defined as the peak-period from 7 am to 10 pm Monday to Friday (excluding Public holidays) over the duration of the contract quarter.

<sup>\*</sup> denotes trades in the product.

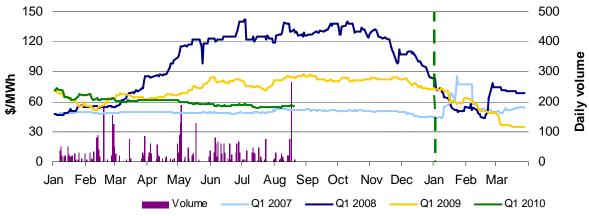

Figure 6: Quarterly base future prices Q3 2009 - Q2 2013

Source: d-cyphaTrade www.d-cyphatrade.com.au

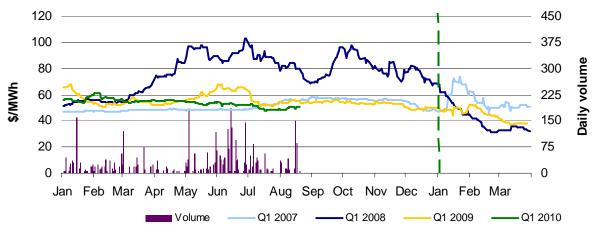

Figures 7-10 compare for each region the closing daily base contract prices for the first quarter of 2007, 2008, 2009 and 2010. Also shown is the daily volume of Q1 2010 base contracts traded. The vertical dashed line signifies the start of the Q1 period for which the contracts are being purchased. To understand the diagrams, the dark-blue line demonstrates that throughout the middle of 2007, the market had an expectation of very high-spot prices in the first quarter of 2008.

#### **Spot market forecasting variations**

The AER is required under the National Electricity Rules to determine whether there is a significant variation between the forecast spot price published by the Australian Energy Market Operator (AEMO) and the actual spot price and, if there is a variation, state why the AER considers the significant price variation occurred. It is not unusual for there to be significant variations as demand forecasts vary and as participants react to changing market conditions. There were 52 trading intervals throughout the week where actual prices varied significantly from forecasts<sup>2</sup>. This compares to the weekly average in 2008 of 130 counts. Reasons for these variances are summarised in Figure 11<sup>3</sup>.

Figure 11: Reasons for variations between forecast and actual prices

	Availability	Demand	Network	Combination
% of total above forecast	0	16	0	0
% of total below forecast	68	9	0	7

\_

A trading interval is counted as having a variation if the actual price differs significantly from the forecast price either four or 12 hours ahead.

The table summarises (as a percentage) the number of times when the actual price differs significantly from the forecast price four or 12 hours ahead and the major reason for that variation. The reasons are classified as availability (which means that there is a change in the total quantity or price offered for generation), demand forecast inaccuracy, changes to network capability or as a combination of factors (when there is not one dominant reason). An instance where both four and 12 hour ahead forecasts differ significantly from the actual price will be counted as two variations.

#### **Demand and bidding patterns**

The AER reviews demand, network limitations and generator bidding as part of its market monitoring to better understand the drivers behind price variations. Figure 12 shows the weekly change in total available capacity at various price levels during peak periods<sup>4</sup>. For example, in Queensland 69 MW less capacity was offered at prices under \$20/MWh this week compared to the previous week. Also included is the change in average demand during peak periods, for comparison.

Figure 12: Changes in available generation and average demand compared to the previous week during peak periods

MW	<\$20/MWh	Between \$20 and \$50/MWh	Total availability	Change in average demand
Qld	-69	75	-78	53
NSW	206	-519	-664	-492
VIC	-190	26	-249	-348
SA	99	-101	17	-113
TAS	7	48	48	-65
TOTAL	53	-471	-926	-965

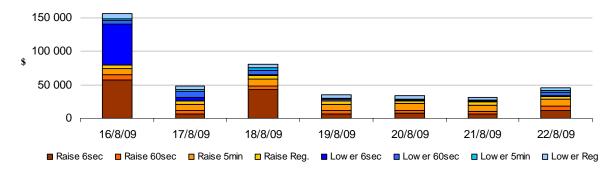

#### **Ancillary services market**

The total cost of frequency control ancillary services (FCAS) on the mainland for the week was \$210 000 or less than one per cent of turnover in the energy market.

The total cost of FCAS in Tasmania for the week was \$220 000 or around six per cent of turnover in the energy market. On Sunday 16 August, at 5.26 am, AEMO declared the simultaneous trip of the two George Town to Sheffield lines as a credible contingency event. This saw the local requirement for the lower 6 second ancillary service increased. The resultant interaction of the Energy and FCAS markets saw the lower 6 second dispatch price in Tasmania reach \$5333/MWh at 6.10 am. At the same time, AEMO cancelled the reclassification of the lines and price returned to previous levels.

Figure 13 shows the daily breakdown of cost for each FCAS for the NEM.

Figure 13: Daily frequency control ancillary service cost

### Australian Energy Regulator August 2009

A peak period is defined as between 7 am and 10 pm on weekdays, which aligns with the SFE contract definition.

## **APPENDIX A**

## **Detailed Market Analysis**

16 -22 August 2009

**Queensland:** There was one occasion where the spot price in Queensland was greater than three times the Queensland weekly average price of \$25/MWh and above \$250/MWh.

#### Thursday, 20 August

11:30 am	Actual	4 hr forecast	12 hr forecast
Price (\$/MWh)	1678.69	14.94	16.03
Demand (MW)	6077	6264	6303
Available capacity (MW)	8985	9319	9353

Conditions at the time saw demand around 180 MW lower than that forecast four hours ahead and available capacity around 335 MW lower than that forecast four hours ahead.

Over two rebids at 9.34 am and 10.13 am, CS Energy reduced its available capacity at Callide B unit two by 350 MW (all of which was priced below \$30/MWh). The reasons given were "P:CALL\_B\_2 COMMISSIONING" and "P:CALL\_B\_2 COMMISSIONING RTS DELAYED". Up to 170 MW of this capacity was returned to service during the 11.30 am trading interval.

At around 11.10 am Swanbank E tripped from 365 MW. The step reduction in available capacity, combined with limited ramp rate capability resulted in the dispatch of plant offered at \$9994/MWh in the 11.15 am dispatch interval.

There were no other significant rebids.
